✓The swelling of micro-sections of natural and compressed pine wood in liquids of different polarities. V. E. Moskaleva. *Trudy Inst. Lesa, Akad. Nauk S.S.S.R.* 9, 124-126 (1953).—The swelling of natural (I) and compressed (II) microtome sections (20 microns thick) of pine was studied. After 2 hrs. immersion of I in H<sub>2</sub>O and in HCO<sub>2</sub>H, AcOH, EtCO<sub>2</sub>H, and PrCO<sub>2</sub>H the percentage of swelling (percentage increase in cross-sectional area) was 27.3, 30.3, 19.8, 11.5, and 6.9, resp.; the percentage decrease in lumen area 22.7, 30, 1, 1, and 1; and the tangential and radial wall thickness of I summerwood tracheids (units given = 0.003 mm.) 2.09 and 3.11, 2.17 and 3.20, 1.96 and 3.00, 1.57, and 2.58, and 1.26 and 2.41. Photomicrographs of acid-swollen II are given. J. An. Lake Keys

U.S.S.R.

The permeability of pine sawwood and heartwood to liquids, and the possibility of its control. V. B. Barchenov and V. B. Moskaleva. *Study Inst. Leningrad Univ. S.S.R.* 9, 227-25 (1955). The tangential and radial H<sub>2</sub>O permeability (I) of pine sawwood and heartwood (II-s and II-h) was detd. on test pieces 21.0 x 1.0 x 0.1 cm. and 15.0 cm. long. Dry II-h was immersed 11 months in kerosine, dried 8 hrs. at 100 ± 5°, and when tested with aq. NaCl solns. was found to have a lower I than untreated II-h. Alc-dry II-h was extd. with iso-PrOH until a colorless ext. was obtained (22 hrs. in 1 case, 35.6 hrs. in another, 7-7.5 hr. ext. removed from the wood), alc-dried, and the I tested with aq. NaCl solns. For II-s, II-h (untreated), and II-h (extd.) radial capillary I (in cc. per day) was 1.60, 0.100, and 1.80, with a max. of 8.50, 0.122, and 2.30, and a min. of 0.80, 0.050, and 0.64; the final av. H<sub>2</sub>O contents were 46.2, 55.6, and 55.9%. A microscopic study of anatomical structure showed that after extd. the resin ducts, particularly in the summerwood, had disappeared. Springwood (sp.) (33 X 12 X 4-6 mm.) and summer wood (su.) (33 X 12 X 1 mm.) of II-h were immersed in aq. solns. of saffranine or methylene blue; the d. (bone-dry wood) of the samples were 0.58 (sp.), 0.32 (su.), 0.60 (sp.), 0.32 (su.), 0.60 (sp.), 0.5, and 0.5; the H<sub>2</sub>O content after 19 days' immersion 173, 75, 170, 106 (after 12 days), 213, and 195, and after 40 days 211, 85, —, —, and —. It is suggested that the I of II-h at right angles to the grain can be increased by treatment with solvent, or by softening or partially dissolving resinous substances in the wood. J. L. K.

The article discusses the GCA and the English equivalent, the SCS-51. It is in the "Foreign Aviation" section and makes reference to the Nov 1945 and the Aug 1946 issues of the "Electronics" magazine. One of the conclusions is that the GCA is much more expensive and more difficult to operate than the SCS-51. Well illustrated.

A single cell in a hanging drop culture is chosen for measurement of nuclear thickness. It is photographed, then embedded in situ in methacrylate and sectioned perpendicular to the plane of the photograph. Thickness of the nucleus is determined with a Zeiss ocular micrometer. Sources of error are discussed and the overall error is calculated to be 7.4 and 4.8% for nuclei of 3 and 6  $\mu$ , respectively.

TITLE: A method of preparing 3,4-bis-(n)-diethylaminoethoxy-(phenyl)-hexane.  
Class 30, No. 152540

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 6, 1965, 130

TOPIC TAGS: hexane, chloride, pharmacology

ABSTRACT: This Author Certificate presents a method of producing 3,4-bis-(n)-diethylaminoethoxy-(phenyl)-hexane by interaction between synestrol and diethylaminoethyl chloride in alcohol in the presence of alkali agents with subsequent distillation of the alcohol, addition of water, and extraction by an organic solvent such as ether. In order to increase the yield of the desired product and to suppress the by-products of the reaction, diethylaminoethyl chloride and the alkali agent are introduced gradually, in several doses, either in solid form or in alcohol solutions. Production of the pharmaceutical preparation is effected by widely accepted methods. In order to reduce danger and to facilitate

Card 1/2

L 41024-65  
ACCESSION NR: AP5008582

the process, a diethylaminoethyl chloride salt is used, such as chlorhydrate. The process is also facilitated and simplified by using caustic potash or caustic soda as the alkali agent. To prevent excessive dilution of the reaction mass, the excess solvent is distilled simultaneously with introduction of the alcohol solutions of the reaction products. For all the synestrol to react, 150-170% of the theoretically computed diethylaminoethyl chloride required is used.

**PURPOSE:** This handbook is intended for mining engineers and skilled personnel of the mining industry.

**COVERAGE:** Volume II of the handbook reviews various methods of underground mining and analyzes the basic principles underlying different types of ore mining operations. Parts I, VI, IX XI, and XV of this volume were written by L. Ya. Tarasov, Mining Engineer, L. Ye. Egel', Geological Engineer, also participated in writing Part I. Part II was written by A. M. Bybochkin, Candidate of Geological and Mining Sciences; Part III by D. N. Ogloblin, Professor, Doctor of Technical Sciences, and M. G. Papazov, Candidate of Technical Sciences; Parts IV, V, and X were written by R. P. Kaplunov, Professor, Doctor of Technical Sciences; Part VII by V. V. Nedin, Professor, Doctor of Technical Sciences, and by Sh. I. Ibrayev, Docent, Candidate of Technical Sciences; Part VIII by N. N. Polyakov, Docent, Candidate of Technical Sciences (deceased) and by M. B. Udalkin, Mining Engineer; Part IX by A. M. Alyamskiy, Docent, Candidate

TITLE: The Separation of Scandium From the Rare Earths and Zirconium (Otdeleniye skandiya ot redkozemel'nykh elementov i tsirkoniya)

PERIODICAL: Tr. Radiyev. in-ta. AN SSSR, 1957, vol 7, pp 141-143

ABSTRACT: A method has been developed for the separation of Sc from the rare-earth elements and from Zr, based on the high solubility of  $(\text{NH}_4)_3\text{ScF}_6$  and the insolubility of fluorides of the rare earths in a solution of ammonium fluoride. Zr is subsequently separated as a phosphate. The following is a resumé of the method. To a solution containing rare earths, Zr, and Sc, a five-fold multiple of dry  $\text{NH}_4\text{F}$  is added (depending on the sum of the elements). The resulting acid is neutralized with ammonia until it has a slight odor. The solution with the precipitated sediments is heated to  $60^\circ$ . The sediment is

Card 1/2

15-1957-10-14148

## The Separation of Scandium From the Rare Earths and Zirconium

centrifuged and washed in a 5% solution of ammonium fluoride. The washing water is added to the filtrate and is treated in a platinum with a 30% solution of KOH. The solution with the alkali is then heated to boiling. Sc and Zr, having been precipitated as hydrates, are filtered off, washed in hot water, and dissolved in a 15% solution of  $H_2SO_4$ . Freshly prepared doubly decomposing ammonium phosphate is added to the resulting solution in order to precipitate the Zr. Sc remains in the filtrate, from which it is precipitated as a hydrate by alkali. The  $Sc(OH)_3$  sediment is filtered off, carefully washed from the  $PO_4^{3-}$ , and dissolved in a small quantity of 2 normal HCl (no more than is necessary to dissolve it). It is then diluted with water to such a volume that the acid concentration is 0.3 normal; and the Sc is precipitated from the solution by oxalic acid. The Sc oxalate thus obtained is centrifuged, washed in a 0.1% solution of oxalic acid, and roasted to form an oxide.

SOV/4853

concerned with the determination of fission yields during the splitting of  $U^{235}$ ,  $U^{238}$ , and  $Pu^{239}$  into 14-Mev neutrons and fission neutrons. Individual studies deal with radiochemical methods of separation and purification of the following fission products:  $Sr^{89}$ ,  $Sr^{90}$ ,  $Zr^{95}$ ,  $Zr^{97}$ ,  $Mo^{99}$ ,  $Mo^{101}$ ,  $Mo^{102}$ ,  $Ru^{103}$ ,  $Ru^{106}$ ,  $Pd^{112}$ ,  $Ag^{111}$ ,  $Cd^{115}$ ,  $Sb^{125}$ ,  $Te^{132}$ ,  $J^{132}$ ,  $Ba^{139}$ ,  $Ba^{140}$ , and  $La^{140}$ , as well as of the following isotopes:  $Ca^{45}$ ,  $Co^{55}$ ,  $As^{74}$ ,  $Au^{196}$ ,  $Au^{198}$ ,  $Tl^{202}$ ,  $Tl^{204}$ ,  $Po^{210}$ , and  $U^{237}$ . The separation and quantitative determination of most isotopes were based on the isotope dilution method. The chemical operations for each of the isotopes were carried out at time intervals that depended on the radioactive transformation of the isotopes. No personalities are mentioned. References accompany individual articles.

Separation and purification of ...

The solution with the precipitate is heated for 10 min, then cooled down, and the  $\text{BaSO}_4$  precipitate is separated out and washed out by means of 0.1%  $\text{H}_2\text{SO}_4$ . The  $\text{Zr}(\text{OH})_4$  is precipitated from the filtrate by a 30% KOH solution. The precipitate is centrifuged, washed by means of 1%  $\text{KNO}_3$  solution, and dissolved in a minimum quantity of concentrated HCl. The  $\text{Zr}(\text{OH})_4$  is precipitated once more, and after its dissolution in concentrated HCl, the solution is diluted to 1 N concentration of HCl. The phenyl arsonate of Zr (I) is precipitated out of the solution obtained by adding 5 ml of the 10% solution of phenyl arsonic acid to 6 N HCl. The sediment (I) is separated out, washed out by means of 1 N HCl (containing 0.1% phenyl arsonic acid), and treated with 5 ml of 10% NaOH solution. The  $\text{Zr}(\text{OH})_4$  precipitated is centrifuged, washed by means of 0.5% NaOH solution, dissolved in concentrated HCl, and the separation of (I) and its conversion  $\text{Zr}(\text{OH})_4$  are repeated. The latter is dissolved in 6 N  $\text{HNO}_3$  by adding 3 ml of 44% HF in 5 mg La. The  $\text{LaF}_3$  precipitated is separated out and washed

Card 2/3

24817

S/081/61/000/011/009/040  
B105/B203

Separation and purification of ...

out in 0.5% HF. Subsequently, the  $BaZrF_6$  is twice precipitated, and treated as described above. The  $Zr(OH)_4$  is dissolved in concentrated HCl, and the precipitation and treatment of (I) by conversion to  $Zr(OH)_4$  is repeated. The latter is reprecipitated by means of the 10%  $NH_4OH$  solution, centrifuged, annealed to  $ZrO_2$  (1000-1100°C), and its activity measured. The chemical yield is 65-70%. The factor of purification from Nb is  $\sim 3.0 \cdot 10^5$ , that from the total of fission fragments is  $\sim 10^7$ . The method described for precipitating  $BaZrF_6$  is suited for determining the activity of Ba. In this case, the previous precipitation of  $LaF_3$  is omitted to prevent a capture of radioactive Ba from the solution by  $LaF_3$ . [Abstracter's note: Complete translation.]

TITLE:

Yields of new fragments in the fission of  $U^{235}$ ,  $U^{238}$  and  $Pu^{239}$  by fission neutrons

SOURCE:

Krupchitskiy, P. A., ed. Neutronnaya fizika, sterank statoy Moscow, 1961, 217-223

TEXT. The authors determined the yield of  $Sr^{90}$ ,  $Zr^{95}$ ,  $Mo^{99}$ ,  $Ag^{110}$ ,  $Te^{132}$ , and  $Ba^{140}$  in the fission of  $U^{235}$ ,  $U^{238}$ , and  $Pu^{239}$  by fission neutrons. A  $U^{235}$ -enriched uranium plate arranged in the thermal column of a heavy water reactor of the A3 USSR served as neutron source. 500-mg tablets and 1 mg targets were produced from each substance to be fissioned. The fission events were recorded in a fission chamber during the entire irradiation period (Fig. 1). The fission fragment yields were determined from their Card 1/A

Yields of fission fragments in

SiO<sub>2</sub>/SiO<sub>3</sub>/O<sub>2</sub>/...  
SiO<sub>2</sub>/SiO<sub>3</sub>

β-activity. The absolute β-activity was measured by two standard instruments with end window counters. These standard instruments were calibrated with preparations of the fission fragments to be studied which had been applied to a silicon film. The absolute β-activity of the standard preparations was determined either with a 4π counter or with an end window counter having window thickness of 0.60 μm. In eight measurements were made in three to four tablets of SiO<sub>2</sub>. The determination error of the fragment yield was between 1 and 10%. The fragment yield is found to depend on the isotope mass number. There are 13 figures, 2 tables, and 7 references. 3 Soviet and 4 non-Soviet. Sciences of the Academy of Sciences of the Ukrainian SSR

PERIODICAL: Ukrainskiy matematicheskiy zhurnal, 1959, Vol 11, Nr 3,  
pp 336-338 (USSR)

ABSTRACT: For the coordination of the problems of research in the sense  
of the XXI<sup>st</sup> Party Conference, on April 22-24, 1959 a plenary  
meeting of the section of the physical-mathematical sciences of  
the Academy of Sciences of the Ukr. SSR took place. There were  
160 participators, members of the Academy, collaborators of the  
section, representatives of the high schools and factories. The  
following questions were discussed:

1. Problems of research (V.N. Gridnev, corresponding member AS  
Ukr SSR)
2. Investigations on numerical mathematics and calculating  
technics (B.N. Malinovskiy)
3. Analytical methods of the quantum field theory (O.S. Parasyuk,  
corresponding member)

Card 1/3

Plenary Meeting of the Section of the Physical-  
Mathematical Sciences of the Academy of Sciences  
of the Ukrainian SSR

SOV/41-11-3-15/16

4. Investigations on probability theory and statistics (B.V Gnedenko, Academician)
5. Theory of electronic processes in dielectrics and semi-conductors (S.I. Pekar)
6. Metal physical investigations and vacuum methods (V. Ye Ivanov)
7. Investigations of radio astronomy (S. Ya. Braude, corresponding member)
8. Solar investigations in the GAO AS Ukr SSR (Ye. A. Gurtovenko)
9. Investigations during the geophysical year in the Poltava Gravimetric Observatory (Z. N. Aksent'yeva, corresponding member AS Ukr SSR)
10. Prospects of the research in 1959-1965.

The academicians N. P. Barabashov, A. G. Gol'dman, A. P. Komar, D. G. Lazarev, and I. Z. Shtokalo, and the corresponding members Z. N. Aksent'yeva, A. I. Akhiezer, Yu. A. Mitropol'skiy, N. D. Morgulis, M. V. Pasechnik, A. Ya. Usikov, and A. A. Yakovkin had a share in the discussion.

The meeting passed a series of resolutions, especially the

TITLE: General meeting of the department of mathematics, mechanics, and cybernetics of the Ukrainian Academy of Sciences

SOURCE: Prikladnaya mekhanika, v. 2, no. 10, 1966, 139-142

TOPIC TAGS: scientific conference, cybernetics, mechanics, nonlinear differential equation, mathematic operator, shell theory, hydrodynamics

ABSTRACT:

A joint meeting of the Department of Mathematics, Mechanics, and Cybernetics of the Ukrainian Academy of Sciences held in Kiev, 18-19 April, 1966 was dedicated to evaluating the results obtained in 1965 by various institutes of the department and to establishing new trends of studies for the future. Ten academicians and 23 corresponding members of the Ukrainian Academy of Sciences and over 110 other outstanding scientists from the Institutes of Mathematics, Cybernetics, Mechanics, and Hydromechanics of the Ukrainian Academy of Sciences and representatives from universities and research organizations in Kiev took part in this meeting.

In the first session, a survey paper evaluating the results obtained in mathematical sciences during the last seven years and in 1965 was presented by the Secretary of the Department, Academician

Yu. A. Mitropol'skiy. He emphasized that Ukrainian scientists made many contributions to the development of mathematical sciences and indicated some of the most outstanding achievements.

In the Institute of Mathematics, the general theory and methods for studying nonstationary processes in nonlinear oscillatory systems and single-frequency oscillatory processes in systems with many degrees of freedom have been developed. These methods made it possible effectively to solve many important problems of modern physics and engineering and they have also been successfully applied to design calculations. The theory of integral manifolds has been developed. On the basis of this work, a series of theorems were proved which are important for solving partial differential equations with small parameters. A cycle of studies in the theory of nonlinear differential equations and the theory of nonlinear oscillations has been completed for which Academician Yu. A. Mitropol'skiy was awarded the Lenin Prize in 1965.

The method of averaged functional corrections was developed, generalized, and applied to the solution of differential and integral equations. The problems of expanding functions in generalized eigenfunctions have been studied and estimates of these functions have been derived for certain classes of self-adjoint nonelliptic operators.

The results of studies in the theory of quasi-conformal mapping found wide application in the solution of many problems of practical importance. A specialized integrator, EGDA, for modeling and solving many applied problems has been developed and approved for lot production. A basis has been established for studies in algebra and numerical analysis.

In the Physicotechnical Institute of Low Temperatures, Corresponding Member of the Ukrainian Academy of Sciences V. A. Marchenko has completed a cycle of studies on the theory of self-adjoint operators and the development of methods for solving boundary-value problems. For these studies he was given the Lenin Prize in 1962.

Fundamental results have also been obtained in the geometry "in the large," in the deformation of convex surfaces and surfaces with outer curvature, in the post-buckling behavior of shells and in their application to problems of mechanics of practical importance. For a cycle of this kind of problems, Academician of the Ukrainian Academy of Sciences A. V. Pogorelov was awarded the Lenin Prize in 1962.

Despite its short existence, the Institute of Cybernetics is generally recognized as leading the USSR in a series of trends of cybernetics. The theory of digital automata and the method for their synthesis developed at the Institute are now widely used in designing computers. For a series of studies in the theory of digital automata, Academician V. M. Glushkov was awarded the Lenin Prize in 1964.

Electronic digital computers (Kiev, Dnyepr, Promin', Mir, and others) have been designed and developed. The theory of mathematical modeling has been developed and has served as a basis for designing the analog computers EMSS-7 and EMSS-8 for design calculations of statically indeterminate systems of beams and rigid frames. The majority of these computers have been approved for lot production. A series of studies on the application of computer technology to automation of production processes have been completed. Algorithms, programs, and methods for solving the optimum transport problems of the USSR as well as methods for calculating PERT systems have been derived. Translators for computers "Kiev," "Ural-1," "M-20," and "Dnyepr" have been developed and a series of studies on the application of mathematical methods in biology and medicine were carried out.

In the Institute of Mechanics, analytic solutions for the problem of designing conical shells of constant and linearly variable wall thickness carrying axisymmetric and symmetric loads are derived. A series of three-dimensional problems of the theory of elasticity, thermoelasticity and thermoplasticity have been solved. Methods for modeling and calculating the state of stress in impellers, thick plates, and cylindrical shells have been worked out. The nonclassical theory of shells has been developed and scientific foundations of the mechanics of shell-liquid systems moving jointly with the stream of heated gas have been established. The theoretical foundations of the dynamic stability of flight vehicles having elastic structures have been laid and experimental methods for studying the state of stress and strain in mechanical systems have been derived. Engineering methods were developed for designing equipment for manufacturing plastics and structures from nonhomogeneous polymer materials. Methods for designing metal and glass-reinforced plastic structures for strength, stability, and load-carrying capacity have been proposed. The theory of designing machines for fatigue strength has been developed. Solutions of numerous problems of stress concentration in plates and shells caused by free and reinforced holes have been obtained by using both linear and nonlinear formulations of problems. In the Kharkov Branch of the Institute of Mechanics, a series of theoretical studies concerning
