TITLE:

Welding of Titanium Alloys in Chambers with Controlled Atmosphere

PERIODICAL:

Svarochnoye proizvodstvo, 1961, No. 4, pp. 24 - 25

TEXT:

The high chemical activity of titanium and its alloys requires careful protection of the weld and the weld-adjacent zone against the gaseous atmosphere. When welding parts of complex contours it is recommended to carry out welding in special chambers. Information is given on manual argon arc welding of titanium-alloy and titanium parts in chambers of two types. Chamber No. 1 is a 0.05 m³ 1Kh18N9T steel cylinder of 1,300 mm internal diameter and 400 mm height. The cylinder top represents a cover fastened with bolts. The chamber is placed on a rotary table and can be rotated around the horizontal axis. In the top and in the walls there are plexiglass windows and apertures for fastening the rubber welding gloves. The chamber is equipped with electric light. The welding burner is fed through a cable which enters the chamber through a special hermetic inlet. The burner is a holder with a tungsten electrode. The absence of a nozzle

Welding of Titanium Alloys in Chambers with Controlled Atmosphere

permits the access to any welding area. The chamber is connected with a vacuum pump, an argon cylinder and an oil manometer. The feed system and the electric circuit are given in Fig. 2 and 3. Chamber No. 2 is made of 15 mm thick "20" grade steel and differs from chamber No. 1 by larger dimensions, which makes it possible to weld large-size parts. The dimensions are: 2100 mm diameter; 600 mm height; 1.8 m^3 volume. Two parallel operating vacuum pumps are employed. The vacuum up to $3 \cdot 10^{-2} \text{ mm Hg}$ is produced within 120 - 150 min. Gas consumption for washing is about 2.5 m^3 . Prior to operation the chamber is blown through with compressed air and rubbed with an alcohol-wetted rag. To fill the chamber, argon of first composition is employed containing not over 0.005% oxygen and not over 0.1% nitrogen. Locksmith tools, base material, technological plates and BT-1 (VT-1) 2 mm-diameter titanium wire are then placed into the chamber and the cover is fastened. After evacuation argon is fed into the chamber at a pressure not less than 0.2 atm. During welding process 1 - 3 l/min argon are supplied into the chamber. Parts of commercial VT-1 titanium, OT-4 and BT-5 (VT-5) titanium alloys can be welded. VT-1 filler wire is employed, which is dehydrogenized in a vacuum of 10^{-3} mm Hg by heating to 950°C . Welding in the described chambers produces high-quality weld joints, whose strength is equal to that of the base metal. The

MUGHA T.

ALEKSANDROWICZ J., GRAPCZYNSKA Z., GUTMANOWA I., KUKLAB., JOZWA J., MUGHA T. AND PACHONSKA J. Univ. in Cracow. Wplyw iperytu azotowego na usterpowanie porazen w. gruzliczym zapaleniu opon mozgowo-radzeniowych leczonych streptomycyna the influence of nitrogen mustard on the regression of paralysis in cerebrospinal meningitis treated with streptomycin *Polsk. Tey.Lek.* 1949, 4/40 (1131-1132)

A decrease of paralysis in TB spondylitis, observed a few hours after the administration of nitrogen mustard, encouraged the authors to investigate its influence on other paralytic states especially in the course of TB. There regression of paralysis in 6 children treated in Clinic for Children's Diseases in Warsaw. This chemical compound was also found to cure paralysis of the peripheral nerves in meningitis of some week's standing but it does not prevent the development of paralysis. Nitrogen mustard was use intravenously in doses of 0.01 g. per kg. body weight daily, repeating doses ever 24 hours from 2-3 times. The therapeutic results are perhaps due to the resorptive and anti-inflammatory action of the chemical, or to irritant action on the nervous tissue. The latter hypothesis is confirmed by observations of certain effects on paralysis of various origin (peripheral neuritis, radiculitis, crania nerve palsy, also in spastic contractures is rheumatoid arthritis) and by some evidence of relief in cases with the clinical symptoms of optic verved atrophy (observed in the optahlomtlogical clinical of Jagiel University). It may be that in the phenomena described there is a chain of reactions, one link of which is the specific action of the nervous system and through it, diminution of the clinical symptoms of inflammation.

TITLE: The effect of micro- and macro-couples on the parameters of electrochemical protection B

CITED SOURCE: Tr. Vses. mezhdug. nauchn. konferentsii po vopr. bor'by s korrozivay, M., Gostoptekhizdat, 1962, 187-193

TOPIC TAGS: corrosion prevention, soil corrosion, electrocorrosion, electro-chemical protection, sea water corrosion, steel corrosion, soil moisture content

TRANSLATION: The use of a constant-current-and-voltage device has made possible a clarification of the difference between electrochemical protection in sea water and in soil. The principal difference between the behavior of steel in sea water and in soil at constant potential is the fact that the current flow increases with time in the soil but decreases in sea water. Tests carried out with the aid of the constant-current-and-voltage device showed that a negative displacement of the potential by 100 mv is sufficient to prevent corrosion of steel in pure sea water

Card 1/3

I 20713-65

and in homogeneous soil with a moisture content of 10-25%. The current density at which corrosion was prevented was 0.5 ma/dm² for sea water, 0.4 ma/dm² for soil with a 25% moisture content and 1.0 ma/dm² for soil with a 10% moisture content. The criterion of cathodic protection of the samples during prolonged polarization in soil was a shift of the potential in the direction of more negative values during depolarization. During depolarization, the potential shifted in the direction of more positive values compared to the stationary state. As the pH of the layer nearest the electrode decreased, the electrode potential approached that in the stationary state. The magnitude and duration of this shift in potential in the soil increased with an increase in the density of the polarizing current and the duration of polarization. The effect of electrochemical protection is therefore not brought about merely by polarization, producing a decrease in the potential difference between individual parts of the underground equipment which are in contact with media differing in physicochemical composition, but also by the change in sign of the current at the anode portions, with a transformation of the anodes of multi-electrode corrosive elements into cathodes. In heterogeneous soil, the distribution of potential along the protected equipment will be non-uniform in character. Electrochemical protection does not exert its protective effect on the equipment as the result of an equilibration of the potential over its entire surface, but as a result of a decrease in the potential difference between micro-

 sinter, Ya. P. Kulikov, Ya. S. Gorbanev, *Met. Ind., Zhdanov, 1957*
 and G. D. Migney (*Met. Ind., Zhdanov, 1957*). — A detn. of the effect of basicity increase of
 sinter from 0.85 to 1.2 and charge in the amt. of 55-60%
 indicated that with a basicity of 1.0-1.2 the coke rate can
 be increased by 8% in the sinter, use of lime-
 stone added, blast temp., blast humidity, and pct% content
 of the sinter were varied. Lowering free CaO content from
 2.5 to 1.35% by grinding limestone to 10% under 6 mm. led
 to a high-sintering temp., a high-FeO content, and lower re-
 ductibility, thus leaving the optimum grinding size for lime-
 stone undecided. Fluxed sinter is more dense and offers a
 higher resistance to the blast; it is more friable, resulting
 in 24% of fines in place of the usual 18% so that sizing is
 beneficial. A partial replacement of CaO with MgO does
 not strengthen the sinter or increase its production. Its
 use is not recommended when the sinter is used in combina-
 tion with ores having an easily fusible gang, but is advan-
 tageous when the gang is refractory. The use of MgO always
 calls for a hot-working furnace.

ABSTRACT: Study of effect of ephedrine, amphetamine and tyramine on the epididymal fatty tissue metabolism in vitro reveals that the "sympatolytic" effect is dose-dependent. Ephedrine even competitively antagonized the norepinephrine lipo-mobilization. Guanethidine, bretylium and phentolamine were used in the study. Orig. art. has: 1 figure. [JPRS]

TITLE: Electric fields underneath thunderstorm clouds

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 8, 1961, 34, abstract 88250
(V sb. "XI General'n. Assambleya Mezhdunar. geod. i geofiz. soyuza, 1957", Moscow, AN SSSR, 1959, 133)

TEXT: At a ground station, measurements were made of electric fields, air streams, point discharge currents, precipitations, charges of individual drops, and the density of free charges. Assuming plausibly that the air contains nuclei among other particles, the distribution of the field from the earth to the ceiling of the cloud can be calculated. It can be asserted that immediately before the flashing of lightning, the electric field on the earth becomes considerably weaker due to the electric spatial charge which is predetermined by point discharges. This explains the fact that the lightning strikes sometimes near elevated objects. Electric spatial charge is concentrated on the lee of elevated objects. The hypothesis can be advanced that the lightning discharges occur more frequently from the lee of the high objects.

MOHARAD, A.

✓ Chemical properties and active group of rhodanese and the mechanism of rhodanese action. *B. Fehér, I. Fodor, S. Zeyerka, and A. Moharad (Közvető Loránd Utca, Budapest). Acta Physico-Chim. Hung. 7, 175-8 (1963) (in English).*—Rhodanese (I) was purified 200-fold from beef liver. The ability of $Zn(OH)_2$ to ppt. the I activity was used to demonstrate that $Na_2S_2O_3$ or O oxidized the enzyme to its disulfide form, and that acetone and H (palladium catalyst), and H_2S reduced the disulfide linkage of the enzyme. The proposed mechanism involved the following: $RSSR + NaCN \rightarrow RSNa + RSCN$; $2RSNa + Na_2S_2O_3 \rightarrow RSSR + Na_2S + Na_2SO_3$; $RSSR + Na_2S \rightarrow RSSNa + RSNa$; $RSSNa + NaCN \rightarrow RSNa + NaSCN$.

Only the first reaction was specific for the catalytic synthesis of thiocyanate.

2. Relative Value of Girasole in Feeding of Milch Cows.

Orig Pub : Allattenyesztes, 1956, 5, No 4, 299-309

Abstract : In a test group, cows were fed 12-15 kg of girasole (G) instead of fodder beets of the same nutritional value. In this group milk yields surpassed the milk yields of control cows by 4.7 percent. In tests with 8 cows a 2.6 percent milk yield increase was achieved when 2 kg of dried pulp replaced 5 kg of G and 0.5 kg of extracted sunflower shreds. The milk fat content did not change. A hypothesis is advanced according to which inulin which is contained in G assists in activating the intestinal microflora, and

Orig Pub : Allattenyesztes, 1956, 5, No. 4, 351-358

Abstract : The methods of studying the activity of the microorganisms of the rumen, and a technique of the use of "artificial" rumen, are described. It was established that carbamide is utilized by the bacteria of rumen for building up the protein of their body. The depression of the digestion of cellulose by starch is stopped when alfalfa hay is being fed.

"The Independence from the Presence of Relaxing Factors of the Substrate Inhibition in Myofibrillar ATPase"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 23, No 2, 1963, pp. 101-104.

Abstract: [English article; authors' English summary] The characteristics of the substrate inhibition of myofibrillar ATPase (the dependence of activity from ATP and Ca concentration) are not influenced by excessive washing of the myofibrils. Furthermore, treatment with deoxycholate and thymol destroys the activity of relaxing granules. The substrate inhibition is according to this property of actomyosin and is not induced by the relaxing factor remaining in the myofibril. Nine references, including 1 Hungarian and 8 Western.

2

1958, 63 (5), 163-165 -- The current from a 110 or 120-V d.c. source passes through a 150,000 to 300,000-ohm resistance to the primary electrodes, consisting of smooth wheels of platinum. The secondary electrodes, situated between the primary ones, are silver-silver chloride connected to a valve voltmeter. The 0.5-1 to 1.0 mA is passed only while readings are being taken. The final readings on the instrument should be ≈ 200 mV. The soln is mechanically stirred. The best results are obtained when 98 to 99 per cent of the p.d. across the source is taken up by the resistance and there is no visible evolution of gas on the platinum electrodes. The distance between the secondary electrodes should be as great as possible; all the electrodes can be moved along a rail. With 0.1 N soln., the method is suitable for the titration of NaOH with HCl and of various sulphates with Ba⁺⁺. On the 0.01 N scale, a 400-V source is needed; for concn. of about 0.2 to 2 N, a special titrating vessel is used.

Q11-6 Heterocyclic

Abstract compounds of 4-aminomethyl-2-methyl-5-hydroxy-3-pyridyl-*pyrimidin*. D. F. and M. M. (Arch. Chem., 1949, 21, 174); cf. A., 1950, 11, 627. — Discussion of 5-amino-4-hydroxy-2-methylpyridine (1.40 g.) and coupling with 5-hydroxy-2-methylpyridine (2.4 g.) gives 4-(5'-amino-2'-hydroxy-3'-methyl-4'-pyridyl)-2-methylpyridine, $C_{11}H_{14}O_2N_4$.

decomp. at 185° without melting. These new arambromanes are synthesized by the reduction of 5-amino-4-hydroxy-2-methylpyridine (1.35 g.) with H_2 over Pt at 100° in a current of H_2 and MeI as catalyst. Thus are obtained 4 : 4'-di(5'-hydroxy-2'-methyl-4'-pyridyl)-2,2'-diaminobromane, $C_{18}H_{22}O_2N_6$, decomp. at 200° without melting; 2 : 2'-dihydroxy-4 : 4'- $C_{18}H_{22}O_4N_4$, decomp. at 200° without melting, and 4 : 4'-dihydroxy-2 : 2'-di(5'-hydroxy-2'-methyl-4'-pyridyl)-2,2'-diaminobromane, $C_{22}H_{28}O_4N_6$, decomp. at 210° without melting. S. S. M. M. M.

PHENYDICHLORARSINE

2

YUGO .

(Phenydichlorarsine (D.C.M.). Nikola Matic. *Lifol*
 1949. *Vicaria* 71. 810-12(1949). 3-Amino-4-hydroxy-
 phenyldichlorarsine, abbreviated as phenyldichlorarsine
 is an antitumor which is prepd. through the following se-
 quence: 4-aminodibenzarsinic acid (I) is acetylated, then
 nitrated to 3-nitro-4-aminodibenzarsinic acid (II), hy-
 drolyzed with base to the 4-hydroxy analog (III), and re-
 duced to 3-amino-4-hydroxydibenzarsinic acid (IV). This
 with HI and SO₂ gives 3-amino-4-hydroxyphenyldichlorarsine
 and chlorinated to 3-amino-4-hydroxyphenyldichlorarsine-
 dichloride (VI). Therapeutic properties of VI are dis-
 cussed and compared to standard antitumorics and the fol-
 lowing conclusions are drawn: the drug is a crystal. sub-
 stance with well defined properties of chemical compds.,
 higher chemotherapeutic action is achieved with a small
 amount of As and oxidation of the material does not in-
 crease the toxicity as it is with the arsenobenzene.

Derivatives of pyrrolisobenzoxazinone acids. N-Methyl- and D. Piel (Phila Pharm. Co., Zagreb). *Arbin* (C.A. 57, 182-5 (1955) (English summary); cf. C.A. 61, 852a). The synthesis is essentially the same as previously described. 2,4-Dimethyl-3,5-carbathoxypyrrrole (I) was prepd. by the method of Koser. I was saponified in 10% KOH, and converted to 2,4-dimethyl-3-carbathoxy-5-pyrrolisobenzoxazinone acid (II) by the method of Koster, *et al.* (C.A. 16, 3085). Decarboxylation of II by dry distn. gave 2,4-dimethyl-3-carbathoxypyrrrole (III). I was also treated with concd. H₂SO₄ by the method of Fischer and Waldsch (C.A. 28, 1037) to give 2,4-dimethyl-3-carbathoxy-3-pyrrolisobenzoxazinone acid, which was decarboxylated by heating at atm. pressure to 2,4-dimethyl-3-carbathoxypyrrrole (IV). Attempts to couple diazotized 3,5-H₂N(O₂C)C₆H₃(O₂C)₂ and III were not successful; a resinous product, which could not be purified, was obtained, and III was isolated from the reaction mixture. Attempts to couple a salt of diazotized 2,4-H₂N(O₂C)C₆H₃AcO₂ (V) with IV were also unsuccessful. 2,4-H₂N(O₂C)C₆H₃AcO₂ (4.34 g.) in 50 cc. H₂O contg. 1.03 cc. concd. H₂SO₄ was diazotized with 21 cc. N NaNO₂ at 0-5° and the product filtered into 3.34 g. III in 20 cc. abs. EtOH. 4-(3-Carboxy-2,4-dimethyl-5-pyrrolisobenzoxazinone acid (VI) pptd. as an orange-yellow powder. VI was filtered, rinsed with water, dissolved in aq. NaOH, and the soln. clarified with active C; acidification with dil. HCl gave 4.3 g. VI, orange-yellow microcrystals, decomp. 210°, slightly sol. in water, somewhat more sol. in dioxane; crys. from dioxane gave well-formed needles. VI was pptd. from aq. soln. with dil. acids. VI was stable in air under light. V (4.66 g.) in 70 cc. H₂O contg. 5.8 cc. concd. H₂SO₄ was diazotized as above and the product filtered into 3.34 g. III in 20 cc. abs. EtOH. 3-(1-Carbathoxy-2,4-dimethyl-5-pyrrolisobenzoxazinone acid (VII) pptd. and added. amt. of VII was obtained on dial. with H₂O. VII was then dissolved in N NaOH, the soln. clarified with active C, added to 0.1 N HCl with const. stirring, and the ppt. was filtered, washed with H₂O, dried, and recryst. twice from dioxane to yield 7.3 g. VII, yellow needles, decomp. 100°. VII was stable in air under light. (p-H₂N)C₆H₄NO₂ (1.46 g.) in 20 cc. H₂O contg. 3.7 cc. concd. HCl was diazotized as above with 10 cc. N NaNO₂ and the soln. added dropwise at 5° or lower to 1.67 g. III in 70 cc. EtOH contg. 5 g. NaOAc. The mixture dissolved in a small vol. of H₂O, on yield 6-Ez 3,3'-[arimidyl(p-phenylene)]bis[2,6-dimethyl-3-pyrrolisobenzoxazinone] (VIII). VIII was filtered, washed with cold H₂O, dried in vacuo, and recrystd. from dioxane and then from ether to yield 1 g. VIII, dark orange microcrystals, m. 131° (decolor.). VIII was sol. in EtOH, dioxane, and CHCl₃. p-H₂N)C₆H₄NO₂ (2.17 g.) in 25 cc. H₂O contg. 0.81 cc. concd. H₂SO₄ was diazotized with 10 cc. N NaNO₂ and the product filtered into 1.67 g. IV in 20 cc. abs. EtOH; when the soln. was clear 15 g. NaOAc in a small amt. of H₂O was added with cooling, and after 1 hr. 4.1 H₂O was added to ppt. 4-(3-carbathoxy-2,4-dimethyl-5-pyrrolisobenzoxazinone acid (IX), yellow-orange powder. IX was twice dissolved in alkali and reprecip. by dil. HCl, washed with water, and dried in vacuo to yield 1.2 g. IX, decomp. 100°, m. 183° (decolor.). IX was sol. in EtOH and dioxane, and stable in air under light.

Paper-stain chromatography of proteins. M. Plantanida, A. Menica, and N. Muic (Yugoslav Acad. Sci. Arts, Zagreb). *Arch. Biochem. and Biophys.* 57, 334-9 (1956); cf. *C.A.* 48, 225c.—The previous finding that proteins can be sep'd. chromatographically on paper strips by the use of buffer concn. gradients was confirmed. A distinctly different but characteristic migration rate in a Na citrate buffer gradient 1:1000 was demonstrated for protamine (*Mugil cephalus*), human γ -globulin, and bovine-serum albumin. The electrophoretically detected slight inhomogeneity of protamine could be confirmed by chromatography. The rate of migration increased with the acidity of the protein, but was not essentially affected by the pff of the buffer between pH 5.1 and 10.1. Albumin migrated to the front and accumulated in the spots; it also showed a marked tailing effect. The rate of migration increased with the concn., especially at high values; the increase is probably correlated with adsorption. The migration rate of the proteins in mixts. was approx. the same as for the separate substances. The new band which appeared for all mixts. contg. protamine and albumin was probably due to complex formation. Felix Saunders

Mulić, N.

Immunochemical and biochemical properties of the *Meddytes viper* venom. N. Mulić (Inst. med. istraživanja, Jug. akad., Zagreb). *Bull. Sr. Conseil acad. R.P.F. Yougoslav.* 2, 105 (1950) (in English); cf. *C.A.* 50, 5810k. -- By means of free electrophoresis 7 protein components were distinguished in the venom, and earlier results were thus confirmed (*C.A.* 49, 0162f, 48, 7201b). Chromatographic analysis of the protein hydrolyzate showed the following amino acids: cystine, glycine, threonine, alanine, lysine, arginine, tyrosine, valine, proline, methionine, leucine, phenylalanine, and tryptophan. The addn. of EtOH to an aq. venom soln. at low temp. (1°), to a final EtOH concn. of 67%, gave an EtOH-sol. fraction, which had 4 times stronger neurotic effect when tested on mice, than the original venom. This fraction was not homogeneous electrophoretically, but evidently was the poisonous principle of the venom in its immature state.

4358. Venom of the spider *Latreutes tredecimnotatus* Reval.
N. Muid, M. Stancic, and A. Menaiga Hoppe-Sevl. *Z. Physik. Chem.*
1953, 205, 70-74 (Inst. f. Med. Untersuch. Jugoslav. Akad.,
Zagreb, Yugoslavia).--A small quant. of the toxin was deposited
on Whatman filter paper by inducing the spider to bite a strip of

the paper. On subjecting the strip to electrophoresis 6 protein
constituents with different mobilities were distinguishable; 2 further
constituents which reacted with ninhydrin were also found. An
immune serum for the toxin was prepared by i.v. injection into a
donkey. Electrophoresis of the immune serum revealed the presence
of a component F, between the β - and γ -globulins, which was not
present in the normal serum of the donkey. (German)
