✓ The ferromagnetic resonance of different materials.
Imre Nagy and Lénárd Pál. Magyar Tudományos Akad.
Központi Fiz. Kutató Intézetnek Közleményei, 4, 460-61
(1950).—Ferromagnetic resonance theory is briefly re-
viewed. The exptl. method was the same as used in pre-
vious work (*ibid.* 3, 563(1955)). Resonance curves of Fe,
Ni, magnetite, and Ni ferrite are given. They show the
absorption and dispersion properties. The γ factor was also
detd. for all 4 materials. They are: Fe 2.03, Ni 2.11, mag-
netite 2.00, and Ni ferrite 2.17. A few measurements were
carried out with a test piece of magnetite. It was found
that the log of the resonance field is proportional to the vol.

Title : The Frequency Dependence of the Permeability of Magnetite Between 1,000 and 3,000 Mc.
Orig Pub : Acta phys. Acad. Sci. hung., 1956, 6, No 2, 341-344.
Abstract : An investigation was made of the magnetic permeability of the magnetite powder, mixed with paraffin, in the frequency range from 1000 to 3000 Mc ($\lambda = 30 \text{ cm}$) for various concentrations of magnetite. The powder grains were 10 microns in size. The permeability was determined from the result of the measurement of the input impedances of a short-

Title: COMBINED FUEL-FILTER

Periodical: Referativny zhurnal, otdel'nyy vypusk, 42. Silovye ustrojstva, no. 5, 1962, 85, abstract 42.5.396
(Hungarian patent class 12d, 2-4, no. 147163, 1.VII.60)

✓3

Text: A patent has been granted for a fuel filter, the element of which is made of synthetic material, e.g. polyvinyl chlorides. The element for the first-stage filter is prepared by mixing pulverized polyvinyl chloride with a water-soluble powder; from this mixture a thin plate is obtained which, after washing out by water, forms the ready first-stage filter element; the fine-cleaning filter is also prepared from pulverized polyvinyl chloride but without any admixtures. The composition of the mixture is given and the process of preparing the filter elements is described. The final fuel-filter is assembled of two concentric rings of the first-stage and the fine-cleaning filtering elements. The resulting fuel-filter retains 99% of solid impurities. There is also a possibility of preparing fuel filters that retain solid particles of about one micron in size. The combined fuel-filter has a relatively low hydraulic resistance and works five times longer (without cleaning) than ordinary felt-filters. There is 1 figure.

"Study of the Immunological Properties of Anti-Prolactin Serum Formed Upon Simple Prolactin Treatment"

Budapest, Kiserletes Orvostudomany, Vol 18, No 6, 1966; pp 640-644.

Abstract: After injection of purified sheep prolactin preparation without adjuvant anti-prolactin (Pr) antibodies appeared in the blood of experimental rats, which showed a precipitation reaction with Pr on an agar gel plate, and which agglutinated sheep erythrocytes sensitized to -Pr in a high titer. The antibodies may be detected in the gamma-globulin of the immune serum by means of immunolectrophoresis. On the basis of authors' studies the sheep-Pr and anti-Pr are considered species-specific from the immunological point of view. The antisheep Pr serum reacted only with extracts of sheep and bovine hypophysis, and showed no reaction with aqueous extracts of human, dog, rabbit, rat, guinea pig and pigeon hypophysis. On the basis of these results it is believed that Pr may be quantitatively determined by an immunological method, but to do this it is absolutely necessary to take into consideration the species-specific property of Pr. 28 References, mainly Western. Stretching and the water content of muscles. E. D. M.

Nagy, J.

Med

5059. Microstructure of striated muscle. I. "Extraction methods". II. The long structure. III. The cross-striation. IV. Contracted forms. E. Ernst, L. Béteczki and J. Nagy *Acta physiol. Acad. Sci. Hung.*, 1958, 9, 7-39 (Biophysic. Inst., Med. Univ., Pécs, Hungary).

—I. The optical behaviour of frog muscle fibres and single fibrils of insect muscle was photographically recorded under polarising microscope in different solutions (Edsall-Weber, distilled water, 0.1% lactic acid, Ringer, etc.) during different stretches and relaxations. It was shown that identical changes in the optical behaviour are brought about by a variety of manipulations, therefore, the disappearance of an optical property (e.g. birefringency) does not prove that it was caused by the extraction of a birefringent substance.

II. Photographic records of native insect muscle fibrillae show the presence of long structures (filaments, protofibrillae) passing uninterrupted through several anisotropic and isotropic discs; they are much thinner and more delicate in the relaxed state. The spiral structure could also be photographed. A very great variability of all these optical properties, thickness of the different discs, direction of the windings of the spiral (in the same fibril), thickness of the 2 discs in the relaxed and contracted state, was found already in the native fibrils.

III. Hürthle's conclusion that the cross-striation is not a static structural part of the fibril but varies with the waves of contractions and relaxations was confirmed. Not all the longitudinal fibrillae of a fibre are simultaneously contracted but often bundles of fibrillae only. From the optical behaviour of *Hydrophilus* fibrilla under different experimental conditions (application of different solvents, stretch, relaxation etc.) it is concluded that the anisotropic disc in the fibril is caused by an enrichment of myosin, the isotropic disc by less thickly packed actin filaments, the Z line is due to an intrafibrillary stratified organization, the M disc can only be a thickening of the substance in the anisotropic disc. The changes in

•1/2

Béleczki, E., Ernest, and Nagy, J.

optical behaviour of the fibril caused by stretch are attributed to physical and chemical changes in the materials making up the fibril elicited by the stretch.

IV. The tighter packing of the cross striation during contraction is attributed to diminution in height and increase in width of the material between 2 Z bands. It is suggested that during contraction only certain parts of the fibrils contract, others in between are stretched. This stretch elicits a stiffening and a further tension increase caused by crystn. 7124. Determination of the excitation function of $^{12}\text{Mg}(\text{d},\text{n})^{14}\text{Si}$ nuclear processes. J.NAGY. Acta phys. Hungar., 3, No. 1, 15-21 (1953).

A half-spherical Mg metal surface is bombarded with the α -rays of a Po preparation placed in the centre of the half sphere. The excitation curves of the resulting $\text{Mg}(\text{d},\text{n})\text{S}$ nuclear processes are measured by the BCl_3 -filled ionization chamber. By measuring the counting rate of the chamber it is also possible to obtain the absolute yield of the nuclear transformation. The neutron radiation is likely to be emitted by the Mg^{25} isotopes.

Title: Investigation of the Kinetics of Chromatography

Original Periodical: Acta Univ. Debrecen, 1955, Vol 2, 167-175 (published in Hungarian with a German summary)

Abstract: Solutions containing infinitely small concentrations of radioactive cations (ThB, Ra, and MsTh) were passed through columns packed with crystalline BaSO₄ powder. The columns were then divided into sections and the specific radioactivity of each section was measured. The distribution of the radioactivity by sections is in good agreement with the theoretical equation $\log (\delta x_i / \delta m) = \log x_e^0 - 0.4343 i \delta m \cdot k'$, where x_e^0 is the specific activity of the top section, i is the sequential index of the layer, and k' is the distribution coefficient between the

Abstract: adsorbent and the solution. This equation can also be applied with finite rates of equilibrium attainment with the additional introduction of a time factor q, the numerical value of which can be calculated theoretically. An equation is also presented for the elution process. Good agreement was observed between the theoretical and experimental values.

Excitation function of the $B(\alpha, n)$ N reaction. János

Nagy, Magyar Tudományos Akad. Mat. és Fiz. Tudományos Osztályának Közleményei 5, 199-204 (1955).—The arrangement used for the investigation of the α, n excitation function of the $B(\alpha, n)$ N reaction consisted of an intense Po source placed in the center of a half sphere made of Cu and lined with B powder. The range of the α -particles was varied by changing the pressure of N in the Cu sphere. The slow neutrons were counted in a counter filled with BCl_3 at 310 mm. Hg pressure. Two nuclear reactions have to be considered: $B^7(\alpha, n)N^11$, $Q = +1.2$ m.e.v., $B^{10}(\alpha, n)N^11$, $Q = +0.28$ m.e.v. The excitation function (no. of n as a function of α energy) showed peaks at 1.33, 1.64, 3.04,

SP

3.30, and 3.6 cm. Of these, 1.64 and 3.04 are due to reaction $B^{10}(\alpha, n)N^11$; all the other peaks to $B^7(\alpha, n)N^11$ reaction. E. Rona.

Title : The Excitation Function of the (α , n) Reaction on Certain Light Elements

Orig Pub : Acta Univ. debrecen., 1956, (1957), 3, No 2, 49-61

Abstract : Using an ionization chamber with ECI_3 , contained in a cylindrical paraffin block, the author has measured the excitation functions of the (α , n) reaction on aluminum, magnesium, and boron. Samples of the above materials were taken in the form of a hollow hemisphere, in the center of which was located a polonium compound. The reaction $Al^{27}(\alpha, n)P^{30}$ begins at $E\alpha = 3.67$ Mev; when $E\alpha = 4.45$ Mev, resonance is observed. The excitation function for magnesium displays two resonances at 5 and 5.3 Mev. The absolute yield of the neutrons is, for this reaction, 3.75×10^{-7} neutrons per α -particle. In the case of boron, the excitation function shows many resonances.

TITLE: Changes in the resistance of erythrocytes and thrombocytes to ultrasound
during radiation treatment of women with cancer

SOURCE: Magyar radiologia, no. 6, 1964, 351-354

TOPIC TAGS: radiology, ultrasonic vibration

ABSTRACT: (Authors' English summary modified) During the radiation treatment of women suffering from carcinoma, the ultrasound resistance of erythrocytes remained unchanged that of thrombocytes, however, decreased. This finding is in agreement with the observation that changes in the blood coagulation factors during irradiation therapy correspond to thrombocytopenia in the majority of cases. Orig. art. has 1 table.
