TITLE: Testing lubricants // for porous bearing bushings //

SOURCE: Strojirenstvi, v. 15, no. 8, 1965, 609-612

TOPIC TAGS: lubricant, porous metal, antifriction bearing

ABSTRACT: The article reports the results of experiments on the problem of reliable lubricants for porous, oil impregnated bearing bushings. Several Czechoslovak oils were used and their properties were compared with certain foreign products. Recommendations derived from the research make it easier to select oils for various conditions. The article was presented by Engineer J. Vins. Orig. art. has: 5 figures and 2 tables. [Based on author's Eng. abstract] [JPRS]

Of 312 patients operated upon psychic disturbances were observed in 14 cases. The changes were: (1) an organic amnesia syndrome with a prevailing defect in memory, signs of amnesic aphasia and confabulation (6 patients), (2) exogenous psychosis of a demented and delirious character with anxiety elements in the first feverish stages of the disease and a melancholic character and paranoid elements in later stages (8 patients).

A positive correlation is demonstrated between the observed results of the chlorpromazine treatment and the increase of the gamma-globulin values as determined by the Kunkel reaction. The group of patients in whom the chlorpromazine treatment had no positive results showed no significant shift in the gamma-globulins. Similar, but less typical changes, were found in the lipoprotein values as was demonstrated by Pospíšil's thymol reaction. No significant changes were seen in the alpha- and beta-globulins as was revealed by Greenspan's APG test.

5279. ACUTE RHEUMATIC PSYCHOSIS WITH A FATAL COURSE - Akutní revmatická psychosa s letálním průběhem - Nahunek K. and Rybáková V. Psychiat. Klin. MU, Brno - ČAS. LÉK. ČES. 1958, 97/27-28 (869-871)

A female patient of 26 contracted an inflammation of the joints of the fingers and ankles with fever, leucocytosis and a systolic murmur over the mitral valve. After out-patient treatment with salicylates she was discharged. Three weeks later a picture of amentia and delirium developed, which made admission to the psychiatric department necessary. The fever increased, whereas the blood pressure, anti-proteinase activity and C-reactive protein content fell. Autopsy revealed endocarditis verrucosa, haemorrhages in the pleura and mesenterium and cerebral oedema. The histological picture of the brain showed small perivascular haemorrhages of the cortical vessels with degeneration of the perivascular ganglionic cells. The heart contained typical Aschoff's nodules. Notwithstanding the atypical course and histological findings, a rheumatic cerebral affection is assumed, in particular on the grounds of the laboratory findings.

3054. LESS COMMON COURSE OF CHLORPROMAZINE PARKINSONISM - Méně obvyklý průběh chlorpromazinového parkinsonoidu - Náhunek K. and Rybáková V. Psychiat. Klin. MU, Brno - ČSL. PSYCHIAT. 1958, 54/3 (173-176)

In a 45-year-old psychotic patient, treated with chlorpromazine and pentazol during the 11th week of treatment, the so-called 'syndrome of the oral region', associated with a strong anxious and depressive reaction, developed. Later, generalized parkinsonian symptoms and painful muscle spasms developed. These disturbances appeared only after the doses of chlorpromazine were considerably reduced and the pentazol injections, which are considered as one of the provoking agents, stopped. With parkopan the psychic disturbances were cured more rapidly than the somatic. Parkopan is recommended in all cases of depressive and other reactions which appear in the course of chlorpromazine therapy, even if the somatic symptoms of Parkinson's disease are not apparent at first.

4780. PENTETRAZOLE-ATARACTIC TREATMENT OF PSYCHOSIS. PRELIMINARY REPORT - Pentazol-ataraktische Behandlung der Psychosen. Vorläufige Mitteilung - Náhunek K. Psychiat. Klin., Masaryk-Univ., Brno - PSYCHIAT. ET NEUROL. (Basel) 1959, 137/1 (33-39) Tables 1

A preliminary attempt was made to carry out a combined pentetrazole-tranquillizer treatment on 84 psychotic patients. This consisted in giving convulsive and subconvulsive doses of the drug during actual treatment with chlorpromazine and reserpine. Good results were obtained in mania and depression, and in what appeared to be acute schizophrenic states, as well as in some cases of chronic schizophrenia. Less satisfactory results were obtained with paraphrenia. Subconvulsive doses of pentetrazole had good effects in melancholia, but were less successful with schizophrenia. This seems an indicated method for treating various types of schizophrenia, particularly when the use of tranquillizers alone is proving of small avail.

"Photometrazol Threshold in Therapy with Some Antidepressants."

Prague, Activitas Nervosa Superior, Vol 5, No 2, May 63; pp 181-182.

Abstract : Studies in 29 patients: 14 on imipramine, 7 prothiadene, 3 propazepine. Imipramine significantly (0.01) decreased by 27.9% the photomyoclonic threshold following metrazol; prothiadene (0.05) by 21.2% and propazepine insignificantly by 7%. Concurrent advisability of small doses of antiepileptics or barbiturates during imipramine therapy is discussed.

Prague, Activitas Nervosa Superior, Vol 5, No 2, May 63; p 197.

Abstract : Brief preliminary report on treatment of 27 psychiatric patients with this thioxanthene analog of perphenazine, used at 125 mg. parenterally or up to 375 mg./day orally for 7 to 29 days, in combination with triphenidyl. Results fair - somehow a little poorer than with perphenazine. No serious side effects.

"Application of a Combination of Reserpine with Trihexyphenidyle in Endogenous Depressive States"

Prague, Ceskoslovenska Psychiatrie, Vol LIX, No 2, April 63, pp 109-110.

Abstract: A combination of reserpine with trihexyphenidyle was used for the treatment of thirty women suffering from endogenous depressions. Their age ranged from 26 to 70. They were administered a daily dose of 3 to 9 milligrams of reserpine and 6 to 15 milligrams of trihexyphenidyle for a period of 5 to 33 days. Preliminary tests showed that the combination has an antidepressant effect.

TITLE: Photomyoclonic threshold in antidepressant therapy

SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 231-234

TOPIC TAGS: nervous system drug, nervous system disease, EEG, pharmacology

ABSTRACT: Imipramine, prothiaden and propazepine lower the photomyoclonic threshold after 10 days of treatment (imipramine and prothiaden substantially, propazepine to a very small extent). These findings correspond to the antidepressive effect of these substances. Because the photomyoclonic threshold and the seizure threshold are closely related, the provocation of epileptic paroxysms by these drugs should be considered mainly for patients with anamnesis fits, or abnormal electroencephalograms. TITLE: Some clinical and experimental experience with proheptatrien ² [This paper was presented at the 7th Annual Psychopharmacological Meeting, Josenik, 20-23 January 1965]
SOURCE: Activitas nervosa superior, v. 7, no. 3, 1965, 291
TOPIC TAGS: therapeutics, drug treatment, psychoneurotic disorder
ABSTRACT: 42 women suffering from endogenic and involuntional depression were treated with the drug. 24 patients showed favorable results and could be discharged. There were frequent side effects. 5 of the patients suffering from severe depression showed deterioration; 2 recovered after transfer to placebo; 3 were cured with electroconvulsions. In the course of the treatment no decrease in photometrazol threshold values could be found. [Orig. art. in Eng.] [JPRS]

"The Antidepressant Action of Phenothiazines and Imipramine Substances."

Prague, Activitas Nervosa Superior, Vol, 8, No 4, Nov 66, pp 353 - 354

Abstract: Investigation conducted on 620 hospitalized patients indicated that when extrapyramidal symptoms are corrected there is no difference between the actions of chlorpromazine, levomepromazine, thioridazine, perphenazine, and fluphenazine. Without antiparkinson correction levomepromazine and thioridazine were superior to other drugs. The potential antidepressant activity of these drugs is related to their antipsychotic-antischizophrenic action. Imipramine type drugs have better therapeutic action on inhibited depression than the phenothiazines. These latter are better than imipramine in anxious, agitated, and atypical depressions. No references. Submitted at the 8th Annual Psychopharmacological Meeting at Jesenik, 18 - 22 Jan 66. Article is in English.

"Preliminary Clinical Tests with Perathiepin. Discussion Contribution."

Prague, Activitas Nervosa Superior, Vol 8, No 4, Nov 66, pp 392 - 393

Abstract: Tests on 4 schizophrenic, and 1 melancholic women are described. 2 of the chronic schizophrenics showed weakening, and complete disappearance of psychopathological phenomena. When for a short time the drug was replaced by a placebo the condition of the patients deteriorated rapidly. In a case of a chronic stuporous catatonia no improvement was achieved. In the 4th case there was some improvement. The fast disappearance and complete cure of the melancholia was astonishing. No side effects of any importance were observed. No references. Submitted at the 8th Annual Psychopharmacological Meeting at Jozonik, 18 - 22 Jan 66. Article is in German.
