Bucharest, Studii si Cercetari de Inframicrobiologie, Vol 14, No 5, 1963, pp 551-563.

Abstract [Authors' English summary modified]: Positive micro-agglutination reactions for rickettsial or pararickettsial germs were obtained in 80% of the serological tests on 100 patients suffering from rheumatic arthrosis processes. The germs were also isolated in white mice and chick embryos for some of the patients. Therapy with tetracyclin group antibiotics resulted in marked improvements. The actual role of rickettsia or pararickettsia as causal agents or as factors reactivating a different pathologic process is still not clear.

Includes 2 tables and 24 references, of which 15 Western, 3 Russian, 2 German and 4 Rumanian.

SOV/97-59-3-7/15

AUTHOR: Nicolau V., Engineer, Professor (Roumanian People's Republic)

TITLE: The Effects of Rate of Loading on the Strength of Concrete

PERIODICAL: Beton i zhelezobeton, 1959, Nr 3, pp 125-127 (USSR)

ABSTRACT: The effect of rate of loading on the strength of concrete is investigated. It is known that if loading is precipitated the crushing value for ultimate loading is increased. Table 1 gives figures obtained during tests carried out by the Scientific and Research Institute for Buildings and Building Materials in Bucharest. As is already known, when loading of concrete is increased very rapidly the concrete behaves as an elastic body. To obtain plastic deformations prolonged loading is required. Without this rapid increase of loading plastic deformations cannot add to the strength of concrete: in fact, the tendency is to the contrary. When the loading is increased more rapidly and the concrete reacts as an elastic body, one would expect the strength of the concrete to fall. The author tested ordinary concrete

Card 1/4 samples for bending, tension and compression, and adhesion

SOV/92-59-3-9/15

The Effects of Rate of Loading on the Strength of Concrete

of concrete to reinforcement. Table 2 gives values obtained during these tests. Fig 1 illustrates the testing of concrete samples for bending and Fig 2 gives diagrams of the strength of the concrete subjected to bending at various rates of increase of loading. The graphs show that the fall in strength at a high rate of loading is 50% for samples kept in air, whereas for examples kept in water this fall is far less. The fall in bending strength in case of rapid loading can be explained by the elastic work of concrete in the elongation zone, which causes a change in the stress picture (see Fig 3). Samples tested for axial elongation are illustrated in Fig 4. Universal press VEB (Werkstoff-prüfmaschine, Leipzig) of 10-15 t capacity was used for testing samples by crushing them within a fraction of a second. The moment of breaking was fixed by means of electronic apparatus. The results of this test are illustrated in Fig 5. When the tests had been carried out at this increased rate of loading per unit time, the tensile strength was 0.35-0.4 of the maximum strength which was obtained at a slower rate of loading (2 sec). Fig 6 gives

Card 2/4 diagram showing the relationship between loading and

SOV/97-59-3-7/15

The Effects of Rate of Loading on the Strength of Concrete

deformation when loading is carried out at an increased rate per unit of time. The loss of strength due to the high rate of loading amounts to 40%. Fig 8 shows the characteristic form of breaking of test cubes. Fig 9 gives graph of the adhesion of reinforcement to concrete. It can be said in conclusion that these tests show that concretes subjected to tension tests at accelerated rates, show much lower values of strength. This applies when the sample is broken in a shorter time than 1 to 2 seconds. In the case of tests carried out in compression there is no reduction of strength. On the contrary the strength is becoming higher. For clarification of the problem of this reduced strength in general, the theory of Griffith should be applied. Apparently when breaking takes place at a rate of loading less than 0.5-0.8 sec, the strength of the concrete does not fall. The author assumes that this phenomenon of loss in strength explains the fatigue of reinforced concrete. Results obtained by T. G. Frolov confirm this theory (Ref 4). In the case of over-reinforced beams Frolov obtained fatigue collapse of concrete in the compressed zone. In this case the adhesion

Card 3/4

SOV/97-89-3-7/15

The Effects of Rate of Loading on the Strength of Concrete

between the reinforcement and the concrete was broken, the compressed zone shrank and fatigue of the concrete resulted. The author also investigated over-reinforced beams (Fig 10). The static limit of a centrally loaded beam was 1800 kg applied progressively over a period of 11 days. The author tested this beam by repeated progressive loading and unloading lasting 18 days, and the breaking was achieved by using an electromagnetic instrument similar to that of TsNIIS of Mintransstroy. Fig 11 shows cracks on a beam which appeared after 50000 cycles of repeated loading and unloading. These tests showed that the compressed zone of the beam diminished considerably and this means that the cohesion between the reinforcement and the concrete had broken down. There are 11 figures, 2 tables and 5 Soviet references.

Calfs in Calves."

Bucharest, Revista de Zootehnie si Medicina Veterinara,
Vol. 11, No. 2, Feb 1967, p. 66.

Abstract: reports that, at the exception of 1 case of 1967,
100 percent of the cases of rickettsial oropoche in calves
or penicillin instilled in the eyes. Alternatively, at 10-15
intervals or immediately for a crisis of 1-2 days
was successful in 90 to 95 percent of cases.

"Results in Combating Spirochetosis in Poultry Farms."

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 13, No 4,
Apr 63; pp 82-87.

Abstract [English summary modified]: Original method: infect geese
(to prevent accidental spread of fowl plague or leukosis), let
spirillum peak (to as many spirochetes as RBC in peripheral blood);
bleed and use as inoculum (0.25 ml./hen, diluted to 20% with saline.)
Treat with organic arsenicals 24 hours later. Excellent results in a
number of flocks, 13000 birds total. Two graphs; 1 Soviet, 3 French
references.

"Erratic Forms of Acanthocephalic Macracanthorhynchus hirudinaceus."

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 13, No 11, Nov 63, pp 76-77.

Abstract: Describes the first reported incidence of infection by this parasite in Rumania. The infection was noted in Arges Regiune and affected pigs raised in Babana Commune. The pigs had been taken to graze at the edge of the woods where various species of Melolontha melolontha and Cetonia aurata were found.

TITLE: Active alumina as a support for catalysts

SOURCE: Revista de chimie, v. 16, no. 11-12, 1965, 550-560

TOPIC TAGS: alumina, aluminum hydroxide, aluminum oxide

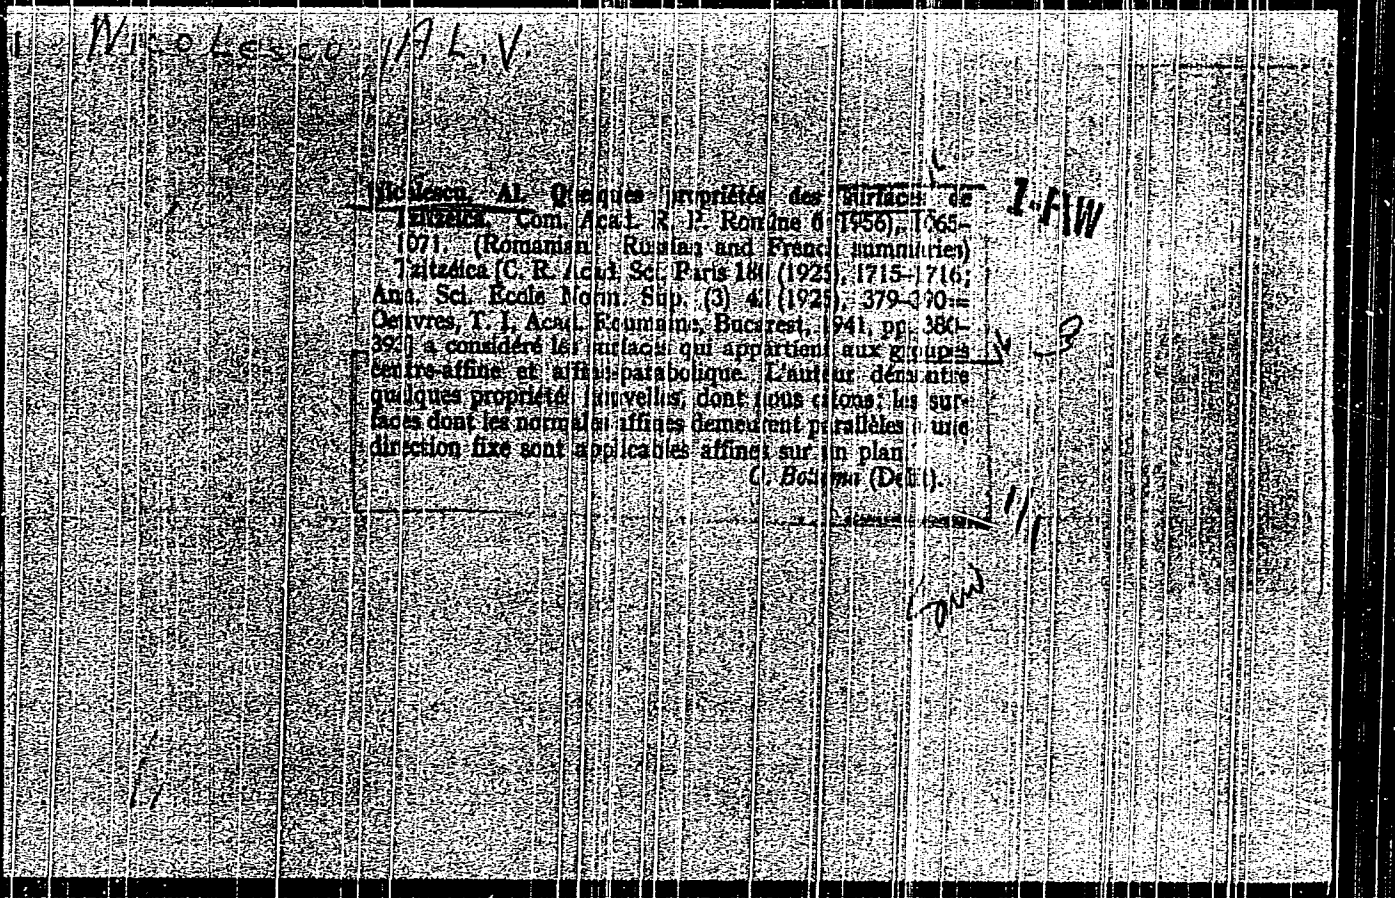

ABSTRACT: A critical discussion of catalytic aluminas. The authors discuss the structural forms under which aluminum hydroxides and oxides occur and the correlation of form with catalytic activity; surface chemistry and physical properties are also examined. Experimental data is cited to show that catalytic activity can be raised 2 to 10 times by influencing isomerization activity through the introduction of organic surface agents in the precipitation medium. "Some Anatomical-Clinical and Therapeutic Aspects of Meniscus
Ruptures."

Bucharest, Revista Sanitara Militara, Vol 62, No 2, Mar-Apr 66,
pp 209-219.

Abstract: An analysis of 111 cases of meniscus rupture treated
during four years at the Central Military Hospital. Best
results were obtained with total meniscectomy, which is recom-
mended over partial meniscectomy; complete recovery was
obtained in all patients, with only a small percentage re-
maining on a limited-activity status. Average convalescence
time after surgery was 45 days.

Terapia tisulară în tratamentul fistulelor digestive - Nicolescu I.,
Andrei A., Minecan N. and Rosenbaum S. Clin II-a Chir., Inst.
de Med., Iași - REV. MED. CHIR. IAȘI 1958, 62/2 (421-424)
A report on 2 cases with highly digestive fistulae, following gastro-hepatectomy,
duodeno-pancreatectomy and cholecystectomy with choledochotomy for mechanical
icterus. Continuous aspiration and the usual therapy failed in both cases but re-
covery was obtained by the implantation of placenta into the fistulous tract accord-
ing to Tretiakov-Filatov's method. The result obtained was spectacular. The tech-
nique is quite simple: there is no risk for the patient and in case of failure the
possibility of surgical treatment is not excluded.

Title : Horse Types Suitable for Farm Work in the P.R.R. People's
Republic of Rumania 7.

Orig Pub : Probl. zootchn., 1957, No 3, 49-52

Abstract : Enduring types of horses of sturdy body build which are suitable for pulling semi-heavy loads at a walking pace and at a trot, as well as for quick transport duty over short distances, are represented by cross-breeds of the Vernier and heavy-work full horse species. They have a live weight of 500 kg, a speed of 24-28 km per hour, and can cover a distance of 10 km with a load of 1,500 kg (70-80 kg pulling power) with an average speed of 7-10 km per hour, at a walking pace and at a trot. Analogous results were obtained when Arab horses were crossed with heavy-work horses. The hybrids have a live weight of 450 kg, transport loads of 450 kg at a trot over a distance

Card : 1/2
