TITLE: Digital deep-sea thermometer 10

SOURCE: USSR. Gosudarstvennyy geologicheskiy komitet. Osoboye konstruktorskoye byuro. Geofizicheskaya apparatura, no. 28, 1966, 144-154

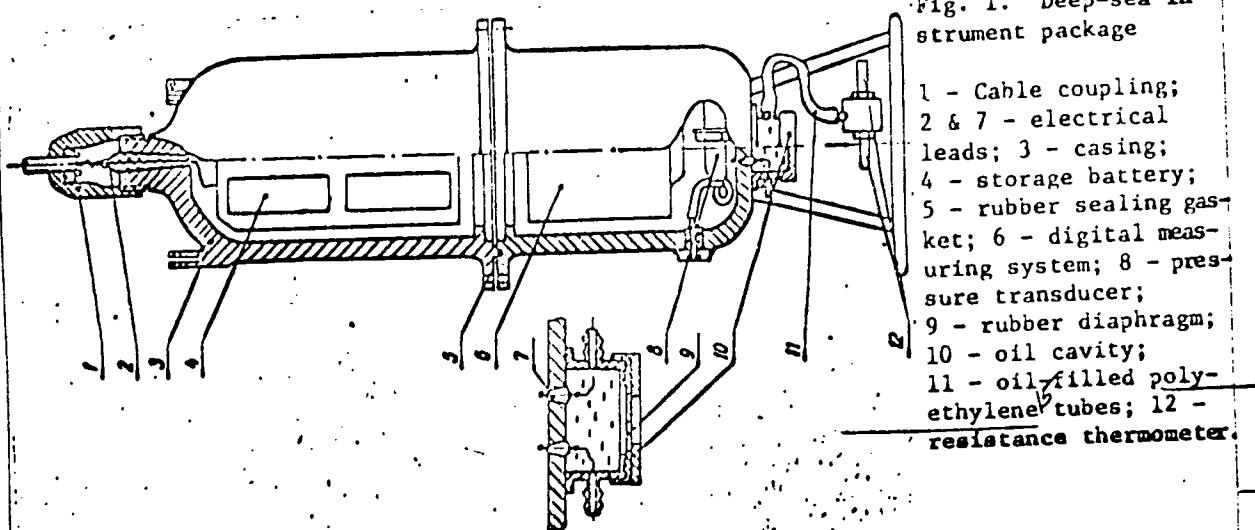

TOPIC TAGS: oceanographic equipment, oceanographic instrument, data recording, recording equipment, parametric converter, digital analog converter, binary code, pulse coding, computer coding, telemetry, telemetry equipment, telemetry system, telemetry technique

ABSTRACT: The authors enumerate some of the shortcomings of various underwater data encoding and transmission systems and describe a fully transistorized experimental deep-sea instrument package (see Fig. 1) for recording temperature and pressure (depth) to 2000 m. The following are the unit's characteristics: 1) depth-measurement range, 0–2023 m; 2) depth transducer measurement error 0.8%; 3) temperature-measurement range, -0.594 to +28.97°C; 4) temperature-transducer time constant, 3 sec; 5) container weight, ~100 kg; 6) length of cable on winch drum, 3.5 km; 7) measurement time for one parameter, 3 sec; 8) scale resolution, temperature, 0.0289°C; 9) scale resolution, depth, 1.99 m. Measurement results are put into a ten-bit

D

binary code and transmitted by a single-core cable to the deck. These results are then converted into an octal code and recorded on control and punched tapes using an STA-2M program punch for a Minsk-1 computer, and on graph paper by an EPP-09 3-point recording potentiometer. Block diagrams of the measuring system and shipboard recording unit are presented, and detailed descriptions of their operation are given. The container measuring system is said to occupy a space 150-mm in diameter and 210 mm in height. Calibration of the instrument package is performed in calm weather using two types of reversing thermometers at appropriate depths. One stated shortcoming of the package is the disparity in precision between the telemetering system and the potentiometric depth transducer. This disadvantage is to be overcome by using a tensometric pressure transducer. Orig. art. has: 3 figures, 1 table, and 3 graphs.

SOV/119-58-8-7/16

TITLE: How to Determine the Economic Efficiency of Automation
(Kak opredelyat' ekonomiceskuyu effektivnost' avtomatizatsii)

PERIODICAL: Priborostroyeniye, 1958, Nr 8, pp. 19 - 22 (USSR)

ABSTRACT: The author criticizes a paper by A. A. Zvorykin and D. N. Kirzhner, Priborostroyeniye, Nr 11, 1957 and describes a method by means of which he believes it possible to calculate the economic efficacy of automatization. This efficacy can be represented by the following formula:

$$\epsilon = \frac{\text{effect}}{\text{expenditure}}$$

Here ϵ denotes economic efficacy, effect - the production of a certain state or effect, its quality and quantity, and expenditure - the total amount spent for the work necessary to bring about the said effect.

The following terms are dealt with in greater detail:

- 1) Productivity of work
- 2) Prime production costs
- 3) Capital expenditure during the period of production and

TITLE: On an approximation method for the solution of the Schrödinger equation

PERIODICAL: Referativnyy zhurnal, Matematika, no. 3, 1962, 30, abstract 3Y161. ("Zh. vychisl. matem. i matem. fiz.", 1961, 1, no. 1, 177-179)

TEXT: One proposes instead of the problem

$$-\frac{1}{2} \frac{d^2 R}{dr^2} + V(r)R = ER, R(0) = R(\infty) = 0$$

to solve the problem

$$-\frac{1}{2} \frac{d^2 \tilde{R}}{dr^2} + \tilde{V}(r)\tilde{R} = \tilde{E}\tilde{R}, \tilde{R}(0) = \tilde{R}(\infty) = 0$$

where $\tilde{V}(r, \lambda_1, \dots, \lambda_s)$ is chosen such that the solutions of the equation

Card 1/2

On an approximation method for the ...

S/044/62/000/003/057 C111/C444

$$-\frac{1}{2} \frac{d^2 \tilde{R}}{dr^2} + \tilde{V}(r) \tilde{R} = \tilde{E} \tilde{R}$$

are known and sufficiently simple functions. The parameters λ_i are chosen such that the potentials V and \tilde{V} only slightly differ from each other on the interval where $\tilde{R}(r)$ is essentially different from zero; e.g. from the condition that the functional

$$\int_0^\infty [V(r) - \tilde{V}(r, \lambda_1, \dots, \lambda_s)]^2 \tilde{R}^2(r) dr$$

becomes a minimum.

One points to the fact that this method has been tested by a large number of examples; two examples are given.

AUTHOR: Nikerov, P. S.

TITLE: Hydraulic stabilizer

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 20, 1961, 11, abstract
20L47 ("Sudostroyeniye", 1961², no. 6, 17-18)

TEXT: The principle of action of the hydraulic stabilizer is based on the properties of waves to collapse in the zone of counterflow. The stabilizer is an assembly which produces on the water surface an artificial flow directed from the ship's board outward. The design of the stabilizer is comparatively simple. On the water-mark level or somewhat higher the ship's hull is surrounded by the working pipe (collector) with holes on which horizontal nozzles are placed. The pump installation, located on the deck or in the ship's hold, presses water into the collector which, under pressure, is ejected from the nozzles in a continuous row of horizontal jets. When hitting the sea surface the jets carry away the upper water layers and produce a surface current beyond the ship's board. The waves running towards the ship and getting into the zone of the counterflow rapidly change their elements: their height considerably increases ✓

Card 1/2

S/123/61/000/020/029/035
A004/A101

Hydraulic stabilizer

while their length decreases. The main advantage of the hydraulic stabilizer consists in the fact that its efficiency does not depend on the running speed and is preserved also while the ship stands. Investigations showed that the power input of the jets can be found according to an expression being presented. For normal operation of the hydraulic stabilizer low-pressure pumps of high capacity are required. The collector should have closely arranged nozzles of a diameter ensuring the passage of large amounts of water. There are 1 figure and 5 references.

Pneumatic breakwater (Pneumatičeskiy volnolom), Moscow, Izd-vo "Transport", 1965. 135 p. illus., biblio. Errata slip inserted. 1,000 copies printed.

TOPIC TAGS: hydraulic engineering, pneumatic device, waterway engineering, harbour engineering, ocean transportation, inland waterway transportation

PURPOSE AND COVERAGE: This book presents a new type of wave gradient construction, the pneumatic breakwater. A short description of the development in foreign and Soviet studies on the theory of pneumatic breakwater is first given, then a basic introduction of its construction and the principle of its operation. Prospects for the uses of the breakwater in open sea and internal harbours are pointed out. This book is recommended for technical engineers in water transportation and hydrotechnical construction, and it can also be useful for scientists, teachers and students in universities and departments of hydro-technical specialties.

TOPIC TAGS: clinical use of betatrons, conferences

ABSTRACT: Report on colloquium held in Bucharest in November 1962 on the initiative of the Romanian Academy of Sciences. Thirty scientists from East Germany, Romania, Soviet Union, Poland, Hungary, and Yugoslavia participated. Papers from the first three countries were the most interesting as these countries had greater experience in construction and operation of these accelerators. Academician Kh. Khulubi of the AN RPR opened the colloquium. Papers were presented by Prof. A. A. Vorob'ev (SSSR) on work done in the Tomskiy politekhnicheskiy institut (Tomsk Polytechnical Institute); Prof. A. Eckart (East Germany) of the Physico-Technical Institute of Jena University; M. Vaksel', A. Brinshok of Dubiana, Institute for nuclear physics (Yugoslavia); K. Iliescu and others of the Betatron laboratory, Institute for atomic physics AN RPR; R. V. Sinitsyn and V. N. Nikeshichev (SSSR); E. Burger and V. Stern (East Germany). Among application

(LUNGS--WOUNDS AND INJURIES)

Tetrahydro-*α*-1-(and 2)-naphthoic acids and their derivatives. S. I. Sergievskaya and E. G. Nikitina. (All Union Chem. Pharm. Inst., Moscow). J. Russ. Chem. (U.S.S.R.) 15, 940 (1943). *α*-1-Aminotetralin (45 g.), 75 cc. concd. HCl, and 200 cc. water were mixed and treated with sufficient water to dissolve the HCl salt; diazotization by 23.6 g. NaNO₂ in 300 cc. water at -5°, followed by addition to 20 g. NaCN in 500 cc. water, 80 cc. 10% NH₄OH, and 31 g. CuCl, stirring for 2-3 hrs., and steam distillation gave 3,6,7,8-tetrahydro-1-naphthoic acid (35.7%), b.p. 130-1°, b.p. 160-7°. Heating 10.7 g. of above with 10.8 g. NaOH, 75 cc. ROH, and 5 cc. water at reflux gave 13 g. of the corresponding acid (I), m.p. 139-40° (after crystallization); solvent not given) and 0.5 g. amide (no m.p.); the hydrolysis may be conducted in a sealed tube at 140° for 8 hrs., using concd. HCl, although the yield is lowered (ca. 30%). The same acid was obtained after alk. KOH hydrolysis of the hydrogenation product of Et 1-naphthoate. I (8 g.), 17 cc. abs. ROH, and 1.5 cc. concd. H₂SO₄, heated 6 hrs., yielded the *Ester*, b.p. 128-9°; hydrogenation of Et 1-naphthoate in ROH, using Raney

Ni at 130° and 50 atm., gave the same ester, b.p. 165-70°. Chloride of I, obtained by heating 12 g. I with 100 g. ROCH₃, b.p. 122-3° (from ROH). The chloride (1.8 g.) in dry benzene and 2 g. R₂NCH₂CH₂OH were refluxed for 2 hrs., and after the usual treatment, treated with Et₂O-HCl to give 2-diethylaminoethyl 3,6,7,8-tetrahydro-1-naphthoate-HCl, m.p. 101-2° (from benzene). Similar procedures were used in the prep of 3,6,7,8-tetrahydro-1-naphthoic acid (from *α*-3-aminotetralin), b.p. 101-4° (30%), acid, m.p. 141° (from ROH) (90%). Et ester, b.p. 135.5°, b.p. 147°; chloride, b.p. 115-10°; amide, m.p. 140-1° (from ROH); 2-diethylaminoethyl ester-HCl, m.p. 152-3° (from benzene). The alkylamino esters are weak anesthetics.

ACCESSION NR: AP4002283

AUTHORS: Sokolov, S. N.; Nikhamina, G. Ya.

TITLE: Laboratory apparatus for determination of specific heat of gases at constant pressure (C_p) by a continuous flow method

SOURCE: IVUZ. Fizika, no. 5, 1963, 179-180

TOPIC TAGS: specific heat of air, air at constant pressure, continuous flow method, specific heat of gas, specific heat isobaric measurement, adiabatic flow calorimeter, calorimetry, thermocouple pyrometer, constant pressure specific heat

ABSTRACT: A laboratory apparatus using a continuous flow method for determination of the specific heat of air at constant pressure (C_p) is described. The basic features are shown in Fig. 1 on the Enclosure. An air blower (1) and a 10-liter cylinder (2) to smooth out pressure variations supply a steady flow of air at a constant pressure p to the calorimeter (3). The volume V of air passing through the calorimeter in a time T is measured by a gas counter (5). An electric heater (4) heats the gas, causing a temperature difference Δt to exist between the entrance

Card 1A

ACCESSION NR: AP4002283

and exit of the calorimeter. This temperature difference is determined by copper-constantan thermocouples (9) and (10), the emf of which is measured by a potentiometer (11). Tables are available for determining Δt from the emf. The current I and voltage V supplied to the heater are measured by the ammeter (6) and voltmeter (7) respectively and can be varied by the rheostat (8). To reduce heat loss, the calorimeter is enclosed by a vacuum Dewar jacket. From the definition of specific heat and using the equation of state of an ideal gas,

$$\epsilon_p = \frac{0.24 I U \cdot RT}{p V \Delta t \cdot \mu}$$

where R is the universal gas constant. μ is the molecular weight of air and T is the average absolute temperature of the gas in the calorimeter. Here T is room temperature plus $\frac{1}{2} \Delta t$. Good results over the course of two years have been obtained with this apparatus by students. Orig. art. has: 9 equations and 2 diagrams.

oblasti khimii i tekhnologii mineral'nykh soley i okislov (Studies in the field of
chemistry and technology of mineral salts and oxides). Moscow, Izd-vo Nauka, 1965,
312-313

TOPIC TAGS: rare earth, rare earth compound, rare earth chloride, double chloride
hydrate, dehydration, fused salt electrolyte

ABSTRACT: A process has been developed for the direct preparation of the fused
chlorides K_3MCl_6 where M is a rare earth element, for the electrochemical/winning of
individual rare earth elements. Prior art included an illogical and technically
difficult step—preparation of individual anhydrous rare earth element chloride.
The newly developed process consisted of dehydrating double chloride $3KCl \cdot MCl_3 \cdot nH_2O$
which was obtained by dissolving a rare earth or rare earth hydroxide in HCl, and
adding KCl in the amount required to form K_3MCl_6 . Dehydrated chloride was melted
under conditions excluding oxygen access. The fused salt contained 52.5–55.5 wt%

Card 1/2

L 21184-66

of the rare earth element chloride and, in most cases, no oxychlorides or oxides of the rare earth elements. Basically the same process may be used for regeneration of the spent electrolyte which contains only a small percentage of the rare earth element chloride. [JK]
