V. 1965 Comparative determination of alcohol with
iodine. I. Reilly and M. 284 20 1965
~~1965 1965 20 1965 1965 20 1965 1965 20~~
method of determining the amount of alcohol in a
sample. The method involves the use of a
catalytic converter to oxidize the alcohol to
acetaldehyde. The acetaldehyde is then
reacted with a solution of iodine. The
rate of reaction is proportional to the
amount of alcohol present. The method
is suitable for the determination of
alcohol in samples containing up to
10% alcohol. The method is simple and
accurate. It is suitable for the
determination of alcohol in samples
containing up to 10% alcohol.

Handwritten initials: PM

"The Problem of Cancerophobia in Clinical Practice."

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 91, No 1, 1963; pp 57-62.

Abstract [English summary modified]: Brief discussion of 17 patients: age, sex and occupations; severity; causes were mostly iatrogenic. Men concentrate on oral-cutaneous regions, women on breast and uterus. Several suicidal attempts. Sedative treatment was required. Too much stress on cancer education can instill too much of a holy fear of cancer especially in emotionally labile, poorly educated persons. Six Western and 3 Yugoslav references.

—Vitamin B₁₂ has a neutralizing effect on the neurotoxic action of tetanus toxin, but the mechanism is not clear. It may combine with the toxin or it may prevent its union with nerve cells. *John T. Myer*

TITLE:

Determination of operating states of output transistors in telemetering systems with quasi-periodic rectangular pulses

PERIODICAL:

Referativnyy zhurnal, Avtomatika i radioelektronika, no. 12, 1962, 62, abstract 12-2-123 b (Publ. Elektrotehn. fak. Univ. Beograda. Ser. Telekomun. i elektron., no. 21, 1960, 16 p. illustr. (Serbo-Croat.; summary in Eng.))

TEXT: The operating states of transistors in telemetering systems are considered, the transistors being used for weight-saving, economy and for increasing the reliability of relays and vacuum tubes. It is shown that it is possible, in a telemetry system with quasi-periodic rectangular pulses, to operate the input channel output transistors at minimum dissipation. The required mechanical forces may be obtained if the output transistors driving the excitation windings of relays and regulators, operate as ideal current switches.
