Moscow mineral water. Uch.zap. MOPI 97:85-92 '61. (MIRA 15:3)
(Moscow Province--Mineral waters)

COUNTRY : Yugoslavia
CATEGORY : E-28
ABB. JOUR. : RZKhin., No. 1959, No. 88289
AUTHOR : Nikshich, M.; Maystorovich, G.
INST. :
TITLE : Processing of Plums
ORIG. PUB. : Pol'oprivreda, 1957, 5, No 1, 44-47

ABSTRACT : Yugoslavia is the second largest producer of plums on a worldwide basis. 5.2% of the plum-crop are used up as fresh fruit, 4.7% are made into plum-butter, candy and jam; 12.5% are processed to prunes, and 77.6% are used to make plum liquor. Export of prunes has been decreasing steadily due to poor quality processing of the plums. It is necessary to improve the quality of prunes, for which purpose it is proposed to expand the growing of the variety Pozhegach and provide modern drying facilities. It is also necessary to increase the output of canned products.

Orig Pub: Pol'oprivreda, 1957, 5, No 1, 39-43.

Abstract: In connection with a diminishing demand for Yugoslavian prunes in Pacific Ocean States where it competes with those from California, attention was given to the quality of certain varieties of plum suitable for drying (Fozhegachi, Ashonki, Ital'yanki and others). The Yugoslavian varieties are better than American ones in the raw material state, but the quality of the prunes is inferior due to a primitive drying. -- Z. Lebedeva.

AUTHOR: Nikso-Nikochio, N.V., Candidate of Biological Sciences,
Moscow

TITLE: Letters to the Editor

PERIODICAL: Nauka i zhizn', 1959, Nr 7, pp 77-78 (USSR)

ABSTRACT: The article deals with "phytocides" (plant toxins killing bacteria and fungi) and "phytocide"-producing trees and shrubs to be planted in the gardens of new housing development areas. The field of "phytocides" is being studied by the Moskovskiy lesotekhnicheskiy institut (Moscow Institute of Forest Engineering) and other institutes. The toxicity of "phytocides" has the following power: it takes the "phytocide"-containing mountain ash leaves 20-30 minutes to kill flies, whereas the "phytocidal" properties of a bird cherry brings death to them after 4-6 minutes. The bird cherry leaves also exercise a deadly effect on white mice, killing them within 20-40

Card 1/2

SOV/25-59-7-49/53

Letters to the Editor

minutes. Humans greatly profit by "phytocides" as the air they breath is thoroughly purified by the latter from microorganisms. Thus, a young pine wood is nearly free of "phytocides" - a fact often made use of in the cure of tuberculosis cases by having them breath the salubrious pine wood air. However, only poor "phytocide"-generating plants such as ash trees are mostly being planted in the gardens of the newly-built housing developments. Preference should therefore be given to the following shrubs and trees able to produce "phytocides" in great quantities: mountain ash, bird cherry, birch, Acer platanoides, black currant, and Thuja occidentalis. The pine and fir also belong to this group, yet they do not qualify since they are unable to withstand the smoke and gas-polluted city air.

AUTHORS: Gvozdev, A.A., Professor, Doctor of Technical Sciences, Mikhaylov, K.V., Nikula, I., Candidates of Technical Sciences

TITLE: Glass-Reinforced Plastics for Reinforcing of Concrete Structures

PERIODICAL: Beton i Zhelezo-Beton, 1960, No. 3, pp. 105 - 111

TEXT: The article deals with the latest development in the field of reinforced concrete, consisting in the employment of non-metal reinforcing material on the basis of fiber-glass. The idea was first expressed by architect A.K. Burov in 1941; since that time extensive research work has been done in the USSR and abroad. Scientists have come to the conclusion, that fiber-glass alone is unsuitable as reinforcement; it can be used, however, in the shape of bars with plastic binders; for better adhesion fiber-glass is treated with silicohydride combinations (silanes). From 1958 to this date special investigations were conducted by the Institute of Concrete and Reinforced Concrete of the ASIA of the USSR. For reinforcing material strips of glass veneer sheets of the Leningradskiy zavod sloistykh plastikov (Leningrad Laminated Plastics Plant) were used. This veneer contained about 67% of fiber-glass by weight, and 40% by volume. The tensile strength of the fiber-glass of non-alkaline composition 14-16 μ in

Card 1/4

X

Glass-Reinforced Plastics for Reinforcing of Concrete Structures

diameter is given as being 8,000-9,000 kg/cm² (in the air); the same fiber-glass, but calcium-chloride-dried, increases in tensile strength to 13,500-15,000 kg/cm². The arithmetic mean value of tensile strength of glass veneer strips is equal to 11,750 kg/cm², in accordance with tests conducted on 150 samples of strips 50-70 cm long. The article gives a formula which shows to what extent the tensile strength depends upon the duration of stress being applied. At a given time the tensile strength has decreased by 35%. Tests have shown that after 10 hours of stress application the coefficient of decrease of tensile strength is 0.7. Tensile strength of fiber-glass is known to depend upon the medium in which it is situated. In this connection tests were conducted in different mediums, which are characteristic of the process of concrete production. In using Ca(OH)₂ which is similar to the action of concrete on reinforcement, it appeared that alkali and water have little effect on the tensile strength of fiber-glass veneer, reducing it by 7-8%. The reaction to high temperature was unfavorable, proving that steaming or autoclave treatment are prohibitive for fiber-glass reinforcement. Tests have shown that in using fiber-glass veneer, it is necessary to allow for reduction in tensile strength up to 40% of the initial nominal strength. Tests were also performed to determine the development of deformation of fiber-glass veneer under brief and long-lasting load. It can be seen that the ratio

Card 2/4

82196

3/097/60/000/03,01,003

Glass-Reinforced Plastics for Reinforcing of Concrete Structures

between the plastic part of the deformation and the final one remains an almost constant value until the breaking point. Tests which consisted in pulling out fiber-glass veneer strips 10-15 cm long from the concrete revealed that the average value of tensile strength of adhesion does not exceed 10 kg/cm². The pulling effort on the strips did not extend to a greater depth than 5-7 cm. Due to the low module of elasticity of glass reinforcing plastics, the summary losses of tension due to creeping and shrinkage of concrete did not exceed 5-6% as compared to 15-20% in case of high-grade wire. Table 2 shows the results of tensile strength and crack resistance tests performed on 15 concrete bars 70-200 cm long, reinforced with glass plastics. The results of the tests agree with the calculated theoretical values, which proves that in designing glass-plastics reinforced concrete it is possible to use the calculating device of Instruction CH 10-57 (SN 10-57). It is economically justifiable to employ glass-plastics reinforcement, when for technical considerations it is not possible to use steel reinforcement. A great deal of research work is yet to be done, until glass-plastics reinforcement can compete with steel reinforcement. The Institut betona i zhelezobetona (Institute of Concrete and Reinforced Concrete) of ASIA USSR

2428. CHANGES IN HIGHER NERVOUS ACTIVITY IN EPIDEMIC HEPATITIS
(Russian text) - Nikulenko N. M. and Savinskii N. G. Tareeva
Laboratory, USSR Acad. of Med. Sci., Moscow - SBORN' BOLEZNI
BOTKINA' (Moskva) (Eds: Tareeva E. M. and Shubladze A. K.) 1956 (183-190)
Twenty-five patients with epidemic hepatitis and 5 patients with cirrhosis of the
liver were examined twice by the so-called verbal or associative method. Com-
parison of the clinical course of the disease with the data of the associative experi-
ment indicated agreement between the duration of the latent period of the experi-
ment and the clinical illness; the latent period of the verbal experiment was reduc-
ed at the peak of the illness and became normal in the period of improvement. In-
crease in the latent period was more marked in patients whose illness was severe.
The experiment indicates the predominance of inhibitory processes in the cerebral
cortex of patients with epidemic hepatitis. In a number of seriously ill patients the
so-called perseveration (multiple repetition of one and the same word in response
to various word-stimuli) and echolalia (replying to an uttered word stimulus by the
same word) were observed; it also indicated inhibition of speech associations. An
increased latent period of the verbal reaction was also observed in the patients
with cirrhosis of the liver; this increase was constant without any deviations to
one or the other side.

AUTHOR: Kruchanu, Ye.; Nikulesku, D.; Vanku, A.

TITLE: Growth from gas phase and study of mercury selenide and telluride single crystals

SOURCE: Kristallografiya, v. 9, no. 4, 1964, 537-540

TOPIC TAGS: single crystal growth, mercury selenide crystal, mercury telluride crystal, vapor phase growth, AIIIBVI compound, crystal structure, crystal habit, crystal lattice constant

ABSTRACT: Methods for growing mercury selenide (HgSe) and mercury telluride (HgTe) crystals from the gas phase have been developed, and their crystalline structure has been determined. The necessity for such a study came as a result of applications of HgTe and HgSe in various semiconductor devices and contradictory information from the literature on their crystalline structure. Two crystal growth methods are described: 1) a dynamic one, consisting of the transport of compound vapors in a hydrogen or argon stream from the sublimation point to the crystallization point with a temperature gradient between

Card 1/1

ACCESSION NR: AP4043190

the two points; and 2) a static method, consisting of the sublimation of compound vapors and their crystallization within an evacuated and sealed quartz ampul, with a 100C temperature gradient. Both methods delivered only HgSe single crystals. The HgTe crystals obtained contained Te in excess of the stoichiometric composition. All crystals were prismatic with a hexagonal cross section. Twin HgSe crystals and hollow, tubular HgSe and HgTe crystals were observed. X-ray studies indicated that all HgSe and HgTe crystals belong to the cubic system, with the sphalerite-type lattice. The lattice constants were determined. The hexagonal modification of HgSe and HgTe previously observed under high pressure is considered to be of the cinnabar-type and not of a wurtzite-type structure. The authors conclude that the general rule observed concerning the wurtzite-type lattice formation in the $Al_2^{III}X_3$ compounds is not applicable to HgSe and HgTe. Orig. art. has: 4 figures and 1 table.

TITLE: Some properties of HgTe single crystals grown from solutions

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1808-1812

TOPIC TAGS: mercury compound, telluride, single crystal growing, crystal lattice structure, electric conductivity, Hall constant

ABSTRACT: The authors describe a method never employed before of growing single crystals of HgTe from dilute solutions, aimed at eliminating previously encountered difficulties with the production of single crystals of stoichiometric composition. The single crystals were obtained from solutions of 5 -- 10 at. % of tellurium in mercury by very slow cooling from temperatures above 4500. Crystals up to 20 x 12 x 1 mm could be obtained by this method. The shape of the crystals depend on the cooling rate. An X-ray structural analysis has shown that the HgTe single crystals have a structure of the sphalerite type with a lattice constant $a = 6.466 \pm 0.002 \text{ \AA}$, corresponding to that calculated on the basis of data on the tetrahedral radii of the Hg and Te atoms. Measurements of the electric properties.

Card 1/2

L 2522-66

ACCESSION NR: AP5014585

3

have shown that the decrease in the carrier mobility is slower than in samples obtained by other methods. This is attributed to the high degree of perfection of the structure of the obtained samples. Measurements were also made of the temperature dependences of the conductivity and of the Hall constant. Doping the HgTe crystals with silver, copper, and other various impurities makes it possible to obtain p-type semiconductor crystals. Orig. art. has: 6 figures and 1 table.

TITLE: Electric properties of certain solid solutions of the system $Zn_xHg_{1-x}Te$

SOURCE: Fizika tverdogo tela, v. 7, no. 7, 1965, 2039-2046

DESCRIPTORS: tellurium compound, semimetal, semiconductor, Hall constant, electric conductivity, thermal emf, solid solution

ABSTRACT: The samples of the solid solutions were obtained by the Bridgman method in quartz ampoules containing previously synthesized tellurides of zinc and mercury in suitable proportions. The samples were cut from the single-crystal parts of the resultant ingots and annealed for a long time (up to 100 hr) in mercury vapor, the pressure of which was monitored. The electric properties measured were the Hall constant, the electric conductivity, and the thermoelectric coefficient as a function of the composition. The results show that such solid solutions are semiconductors of n-type with a mixed character, and no transition to metallic conductivity was observed. In the region of the composition where the mobility has a maximum, which is related by the authors with the presence of a certain amount of the effective

TITLE: Growing of HgSe single crystals from melts and some of their properties

SOURCE: Kristallografiya, v. 11, no. 2, 1966, 305-311

TOPIC TAGS: mercury compound, selenide, single crystal growing, crystal lattice dislocation

ABSTRACT: The authors propose a new method of growing HgSe single crystals, consisting of slowly cooling from dilute solutions of selenium in mercury, with selenium concentration 4--8 at.% from 670C. It differs from earlier methods in the low percentage of the selenium in the melt. The procedure yielded single-crystal platelets, most frequently in rhombic or triangular form, with thickness 0.8--1 μ m and length 10--15 μ m. X-ray investigations have shown the most developed surfaces of these plates to be the planes with indices (111). The crystals had a low dislocation density, and had electric properties similar to those obtained by the Bridgman method. It is concluded from this similarity that no matter how the crystals are grown, they contain an excess of mercury atoms. This is in contrast with the behavior of HgTe, whose crystals always grow with an excess of tellurium atoms. Tests with addition of silver (1% of the total selenium amount) have shown that silver is not a suitable

ACC NR: AF6011473

3

doping impurity because of its very low solubility in mercury at low temperatures. The fact that the method described makes it possible to grow crystals of sufficiently large size, with low dislocation density, and with mirror surfaces which require no polishing or etching, makes this method very promising, especially when the sensitivity of the surface of the samples to mechanical or chemical working leads to inaccurate measurements of the reflection. The possible diagram of state of such a crystal is discussed. The authors thank M. Nikulesku for help with the measurement of the electric properties of the HgSe crystals, and also I. Stanculescu and S. I. Ionescu-Buzher for valuable discussions. Orig. art. has: 8 figures.

TITLE: Electromagnetic Isotope Separating Device for Heavy Elements of High Resolving Power. (Elektromagnitnaya ustanovka s vysokoy rezreshayushchey siloy dlya razdeleniya izotopov tyazhelykh elementov)

PERIODICAL: Atomnaya Energiya, 1957, Vol. 3, No 12, pp. 483-491 (USSR)

ABSTRACT: The constructed apparatus, which shall be able to separate clearly isotopes even with a relative mass difference of $1/240$, must have a high dispersion, a high resolving power and especially well stabilized magnetical and electrical fields. An axial-symmetrical field, the dispersion of which is proportional to the square of the focusing angle, was used as a magnetic field. The focusing angle is 225° . The measured dispersion of the apparatus amounts to 20 mm at a relative mass difference of the masses to be separated of 1%.
The stabilization of the magnetic field of the separating device has been brought to 0,005% by the aid of a valve scheme. The acceleration velocity for the source of ions (up to 40 kV) is stabilized by a double cascade scheme up to 0,01%. But also the current in the discharge source of ions is stabilized. The vacuum chamber is constructed from stainless steel, in a (-sharp). The

Card 1/3

Electromagnetic Isotope Separating Device for Heavy Elements of High Resolving Power.

59-12-1/29

pump system has been arranged so that a working vacuum of $4-6 \cdot 10^{-6}$ mm Hg is always guaranteed. When separating toxic materials moving locks, valves and regulators from synthetic and rubber are applied. The high vacuum here is maintained by means of a surge chamber.

A normal gas discharge source of ions, in which the material to be separated can be heated up to 1000°C , is used as source of ions.

Boxes from copper or graphite are usually used as targets. The following results were obtained:

Concentration factor:

75	to	302	for	Pb ²⁰⁸	concentrated from the natural lead-isotope mixture	
22	to	71	for	Pb ²⁰⁷	"-

AUTHOR: Nikulichev, Ye. P. and Chicherov, L.G.

TITLE: Standard Series of Submersible Centrifugal Electric Pumps (Normal'nyy ryad pogrushnykh tsentrobezhnykh elektronasosov)

PERIODICAL: Neftyanoye khozyaystvo, 1957, Nr 6, pp. 27-32 (USSR)

ABSTRACT: Oil well exploitation by means of rodless submersible electric pumps results in higher yields, longer runs without repairs, and lower cost of production. The superiority of these pumps over rod pumps has been experimentally established at the Petroleum Production Administration of the Oktyabr'skiy Petroleum Industry (NPU Oktyabr'neft) belonging to the State All-Union Association of the Grozny Oil and Gas Industry (ob'yedineniye Grozneft') and at the Petroleum Production Administration of the Ordzhonikidze Petroleum Industry (NPU Ordzhonikidzeneft') subordinate to the Ministry of the Petroleum Industry of the Azerbaydshan SSR, also at the TsNIIT'neft' Institute, and at the Special Design Bureau for ram pumps (OKB po beshtangovym nasosam). At present the limited number of standard type (5-6) submersible electric pumps does not satisfy oil field demand and in order to solve this problem the OKB for rodless pumps has prepared specifications for a standard series of submersible electric pumps. Fig. 1 shows the method by which the dimensions of submersible pumps and electric motors were determined for wells with casing strings of 5 3/4",

Card 1/2

93-6-8/20

Standard Series of Submersible Centrifugal Electric Pumps (cont)

6 5/8", and 8 5/8" and minimum inside diameters of 122, 144, and 194 mm. respectively. For wells with a 7" casing string, the same pumps as for 5 3/4" and 6 5/8" casing strings were recommended, and for wells with casing string of more than 8 5/8" any pump of the new standard series will do. Table 1 gives the diameters of the pumps and submersible electric motors. The efficiency of the pumps was calculated with the aid of OKB formulas derived by experiments and verified by testing the stages of small dimension pumps. It was established that the full efficiency of a submersible pump varies from 40 to 60 per cent depending on the dimension and delivery of the pump (Table 2). The approximate maximum motor capacity for wells with 5", 6", and 8" casing strings was established as 40, 100, and 190 kw., respectively. The length of a pump or motor was established as 7 m. The maximum head of a pump was calculated from data on a duplex or triplex pump powered by one electric motor. The possibility of coupling pumps was tested using the EN-70-1500 and EN-40-1000 pumps. The main parameters of pumps for wells with 5", 6", and 8" casing strings were established on the basis of the above calculations. Some of these parameters are given in Table 2. Determination of pump delivery and head made it possible to present graphically the ranges of application for electric pumps (Figs. 2, 3, 4). These charts show by means of A.N. Adonin curves the application ranges of rod and electric pumps for wells with

262. INVOLVEMENT OF THE PERIPHERAL NERVOUS SYSTEM IN BRUCELLA
LOSIS (Russian text) - Nikulicheva Y. S. - TRUDY INST. KRAEV. PAT-
OL. AKAD. NAUK KAZ. SSSIOTSG. 3 (107-137)

Involvement of the peripheral nervous system was noted in 244 of 292 patients with acute and chronic forms of brucellosis. Sometimes root symptoms were the first manifestations of the disease. Involvement of the peripheral nervous system manifested itself by neuralgia, neuritis, radiculitis, radiculoneuritis and plexus neuritis. Considerable preponderance of sensory disorders over motor disturbances is characteristic; autonomic disturbances are marked. The roots and nerves of the lumbosacral region are most frequently affected, more rarely those of the cervical region and only exceptionally the cranial nerves (trigeminal neuralgia, paresis of the facial nerve). There is confirmation of the view expressed in the literature that the majority of patients suffer from a combination of joint, muscle and nerve involvement, which makes it possible to speak of a polyarthroneuromyalgic syndrome and to consider it as characteristic of brucellosis. Treatment is primarily specific; procaine injections are effective as symptomatic measure. The best results were obtained on combination of vaccine and brucellin with procaine; less effective was the combined therapy using procaine with Uvarov's serum and antireticular cytotoxic serum. TITLE:	Experiences in the production of gasoline and diesel fuel from highly sour crudes			
SOURCE:	Khimiya i tekhnologiya topliv i masel, no. 6, 1966, 7-10			
TOPIC TAGS:	gasoline, diesel fuel, petroleum refining, petroleum refinery equipment			
ABSTRACT:	A destructive-adsorptive desulfurization process for sour feedstocks was developed in laboratory and full-scale runs at the Ufa Order of Lenin Petroleum Refinery (Ufimskiy neftepererabatyvayushchiy zavod) to reduce production costs and particularly the consumption of hydrogen, the insufficient supply of which is limiting the output of hydrodesulfurized fuels. An aluminum silicate catalyst and the catalytic cracker type 43-102 were used at 390-420C and 1.2-1.8hr ⁻¹ space velocity to produce 75.7-82.2% and 7.9-11.1% yields of diesel fuel and naphtha, respectively, decreasing the sulfur content to approximately 50% of the input value and to not more than 1% after blending with light straight-run fractions. The cost of diesel fuel was approximately 20% lower as compared with hydrorefined fuels. Use of the cracking unit for the process is recommended when heavy feedstocks for catalytic cracking are in short supply. The unit was also employed for desulfurization of thermal cracking

Hypothyroidism and infarction reactions
Langer, A., Numa, P., Stern, A. *Misurugi* 1964, *M. J. Clin. Med.* 101: 100-102. *Yugoslavia*. The reaction to carbon 14 after injection into the granular part of the rat was weaker in thyroidectomized rats than in normal rats. This is explained by a lower, intracellular content of the acid of thyrocytes in rats. However, it is possible that the acid of rats is not in the same amount as in the normal rats.

Title : Inflammatory Reaction and Diabetes.

Orig Pub : Med. pregled, 1957, 10, No 5, 277-280

Abstract : The formation of granulation tissue in the inflammatory sac according to Silve in rats with alloxan diabetes is considerably inhibited. The healing of the skin in inflammation is slowed down in rats with diabetes due to increased content of histamine. -- From the author's resume.

TITLE: A method of heating a liquid-metal bath. Class 18, No. 176935.
[announced by the Central Scientific Research Institute of Yaroslavl
Metallurgy im. I. P. Bardina (Tsentral'nyy nauchno-issledovatel'skiy
institut chernoy metallurgii)]

SOURCE: Byulleten' izobrateniy i tovarnykh znakov, no. 24, 1965, 30

TOPIC TAGS: metal, metal melting, vacuum melting, arc melting,
magnetically controlled arc

ABSTRACT: This Author Certificate introduces a method of heating a
metal bath in a vacuum arc furnace. In order to obtain an improved
crystal structure in the ingot, the electric arc is moved on the
surface of the bath under the effect of differently oriented alter-
nating magnetic fields. [WW]
