TITLE: A suspension method for obtaining high-molecular polystyrene

PERIODICAL: *Plasticheskiye massy*, no. 1, 1961, 3-7

TEXT: In view of the great commercial advantages of suspension polymerization, the authors studied the most favorable conditions for obtaining high-molecular polystyrene with good physical, mechanical, and dielectric properties. In doing so, they applied the method of suspension polymerization. A study has been made of the influence of initiators and their mixtures, as well as of stabilizers and reaction temperature. The various initiators were synthesized by alkylation or acylation of H_2O_2 or Na_2O_2 . X

First, polymerization was done in a nitrogen atmosphere at 20-95°C with a monomer-to-water ratio of 1:3 or 1:6, and with 0.5-2% initiator referred to styrene. The authors aimed at obtaining a granulated polymer. Results are summarized in Table 1:

Experiments with benzoyl peroxide (I), tert-butyl peroxide (II), and tert-butyl perbenzoate (III) were made in autoclaves (50,200,600 l capacity), using Solvar as a stabilizer (partly saponified polyvinyl acetate with 12-13% acetate groups). Monomer-to-water ratio = 1:2; temperature: 80-95°C or 80-130°C. These experiments confirmed the results of laboratory tests. Granulated polystyrenes with a molecular weight of 100,000-120,000 were obtained. At 130°C the reaction took place within 9-10 hr, the polymer containing only 0.3% of the initial monomer. A comparison between these styrenes and those obtained by block polymerization is presented in Table 3:

Property	suspension polystyrene obtained with:			block polystyrene
	0.5% I	0.3% I + II	1.5% III

S/191/61/000/001/001/015
B101/B205

Suspension polymerization of styrene in the presence of polystyrene was studied in addition. Ordinary styrene and styrene thermally polymerized up to 30% were further polymerized in an aqueous suspension. Using I and II in a ratio of 1:1 as initiators, a polystyrene with a molecular weight of 140,000 was obtained. Polyvinyl alcohol, Solvar, sodium polymethacrylate, copolymer from methyl methacrylate and methacrylic acid, gelatine, $Ca_3(PO_4)_2$, $Mg(OH)_2$, talc, etc. were tested for stabilization.

0.5% copolymer from methyl methacrylate and methacrylic acid, or 0.1% Solvar were found to be the most favorable stabilizers. The polystyrene fraction with a particle size of 0.5-0.1 μ m amounted to 60-80% of the total amount of the polymer. There are 3 tables and 10 references: 2 Soviet-bloc and 8 non-Soviet-bloc. ✓

AUTHORS: Nosayev, G. A., Stepanova, R. N., Samarina, O. P.

TITLE: Peresters as initiators of the polymerization of vinyl compounds

PERIODICAL: Plasticheskiye massy, no. 7, 1961, 8-12

TEXT: The authors studied the initiating effect of peresters synthesized from tert-butyl hydroperoxide and monobasic aliphatic and aromatic acids on the polymerization of styrene. The activity of the initiators was determined by a new method. The suspension polymerization of styrene was conducted in 25-ml ampoules filled with 5 g of styrene, 15 g of distilled water, 0.05 g of perester, and 0.005 g of "Sol'var" (partially saponified polyvinyl acetate with 13 % acetate groups) as stabilizers. The ampoules were fastened to a swivel frame and heated in a thermostat up to 90 or 110°C. After equal periods of time, the ampoules were opened and the polymer formed was immediately dried in the ampoule at 55°C and 5 mm Hg. Tert-butyl ester of peracetic acid (1), perchloroacetic acid (2), perlauric acid (3), perstearic acid (4), methyl peroxy-carbonic acid (5),

Card 1/3

Peresters as initiators of the...

permethacrylic acid (6), perbenzoic acid (7), per-orthochlorobenzoic acid (8), per-parachlorobenzoic acid (9), per-metanitrobenzoic acid (10), percinamic acid (11), and perhydrocinnamic acid (12) were studied. At 90°C, the activity was reduced in the following sequence: (1) > (11) > (12) > (6) > (5) > (9) > (8) > (3) > (4) > (7) > (10) > (2). In the first seven reagents of this sequence, polymerization was completed after 6-8 hr. In (2), (10), (7) the conversion of styrene after 12 hr was only 80%. The activity was reduced by introducing chlorine into the chain of the acryl radical, or NO₂ into the benzene ring. By introducing Cl into the benzene ring, however, the activity was increased, whereas different positions of Cl were almost ineffective. In aliphatic peresters, the activity decreased as the length of the acryl radical increased. In aromatic peresters, a side chain increased the activity. Unsaturated (11) was somewhat more active than saturated (12). At 110°C, the rate of polymerization on the average is twice that observed at 90°C. At 110°C, the polymerization rate of (2) was four times that observed of 90°C and, thus, approached that of (1) at the same temperature. At 110°C, (4) was just as active as (1). The molecular weights were calculated according to Staudinger. Polymers with the highest molecular weight (105,000-120,000)

Card 2/3

Peresters as initiators of the...

24744
S/191/61/000/007/002/010
B101/B215

were obtained with (4) and (5) at 90°C. Under the same conditions, benzoyl peroxide yielded a polymer with a molecular weight of only 25,000. A temperature increase from 90° to 110°C reduced the molecular weight by 1/2 - 1/3. The presence of atmospheric oxygen affected the activity of the peresters except (2) whose activity in air is higher than in nitrogen atmosphere. This perester is of interest since in its presence the molecular weight of the polymer remains almost unchanged at 90 and 110°C (76,000-75,000), and is much higher than the molecular weight obtained by other compounds at 110°C (31,000-58,000). There are 4 figures, 2 tables, and 3 Soviet-bloc references.

S/191/65/000/003/003/622
E101/B186AUTHORS: Konayev, G. K.; Stepanova, R. K.

TITLE: Study of the heat resistance of peresters and comparison of this with the initiating effect during polymerization

PERIODICAL: Plasticheskiye massy, no. 3, 1965, 7-11

TEXT: A test was made of the rate of thermal decomposition of tert-butyl peresters of aliphatic, aliphatic-aromatic, and aromatic acids and of their activity during the polymerization of styrene. Thermal decomposition was tested in 0.1 - 0.2 mole% solution in benzene at 80 - 150°C by determining the decay constant and the half-life (hrs). The initiating effect was tested by polymerization of an aqueous styrene suspension. For 90°C, the following data were obtained (first number: half-life, second number: activity of initiation): tert-butyl perhydrocinnamate 11.0, 6.0; tert-butyl-percinnamate 11.6, 6.0; tert-butyl perchloracetate 16.5, 15.5; tert-butyl perlaurate 17.3, 9.0; tert-butyl per-o-chlorobenzoate 21.0, 8.5; tert-butyl perstearate 22.1, 10.0; tert-butyl per-m-methoxy benzoate 34.0, 7.0; tert-butyl methyl peroxy carbonate 34.7, 9.0; tert-butyl peracetate 38.2, 6.0; tert-butyl

Card 1/2

Study of the heat ...

perpropionate 57.8, 5.5; tert-butyl perbenzoate 71.5, 12.0; tert-butyl per-m-nitrobenzoate 85.0, 15.0. In general, the initiation activity increases with half-life. A deviation from this rule in tert-butyl permethoxy benzoate, tert-butyl peracetate and tert-butyl perpropionate is explained by hydrolysis, in tert-butyl perchloroacetate it is explained by liberation of HCl causing a reduction in pH. There are 3 figures and 2 tables.

Title : Utilization of ultra-acoustics in exploration of generalized
critical phenomena.

Orig Pub : V. sb. Primeneniye ultra-akustiki k issled. veshchestva.
Vyp 3 M, MOPI, 1956, 71-83.

Abstract : The problem of ultra-acoustic measurements utilization in
study of generalized critical phenomena is discussed. It is
shown on example of liquid mixtures possessing a critical mix-
ture temperature that the speed of the sound (S) cannot be
used as a general thermodynamic characteristic of critical
areas of liquid-liquid and liquid-vapor. Unlike density and
thermal capacity, the character of variation of the speed of
the sound is different for different mixtures. The behavior
of adiabatic compressibility coefficient of systems liquid-
vapor and liquid-liquid is also specific in the critical area
of each of them. In contrast to that, thermal capacities and

Title: Experience with Purification of Alkaline Waste Water of Dye Works
in a Freibisch Unit

Original
Periodical: Zkusenosti s cistenim alkalickych barevenskych odpadnich vod na
Freibischove cistirne, Voda, 1953, 33, No 7-8, 196-200; Czech

Abstract: A comparative evaluation of procedures for the purification of waste
water (WW) containing indanthrene and naphthol dyes. The experi-
ments were carried out with a Freibisch unit consisting of a settling
tank and 5 biofilters connected in series. Handling capacity of the
unit 40 m³/day. With continuous flow of WW through the filters,
its coloration is not removed, BOD is reduced by 45%. On holding
the WW in the filters for 2-3 hours BOD is reduced by 50% but

Title : Purification of Phenolic Sewage Water of Brown
Coal Gasification

Orig Pub: Voda, 1956, 35, No 10, 342-347

Abstract: Description of the purification in cinder filters.
On new filters a process of adsorption takes
place, on filters which have been in operation --
a process of oxidation, with O₂ of the air. The
cinders act as catalyst. Depth of the cinder bed
is of 2-2.5 cm. The sewage water is fed at a uni-
form rate onto the cinder surface from a height of
about 1.5 meters. Technical details are described.

Title : Water Economy Problems in Connection with Acid Polish-
ing of Glass.

Orig Pub : Sklar a Keramik, 1957, 7, No 8, 228-229

Abstract : HF (Acid) of 70%-75% conc. and 98% H_2SO_4 are used for
polishing and etching of glass. The composition of
drainage waters (DW) differs from that of polishing tub
waters not only in concentration but also in a different
ratio of H_2SO_4 to HF (acid). A daily loss of HF reaches
20% of the total used for polishing at 60-70°C. The
loss of H_2SO_4 is 5%. Also discussed are problems of
(DW) disposal and their neutralization with limestone.
