Use of Paper for Protecting Sprouts.

Orig Pub: Byul. nauchno-tekhn. inform. N.-i. in-ta ovoshchn.
kh-va, 1957, No 3, 24-26.

Abstract: At the Perlovskoye Department of the Institute's experimental base in 1954-1955, experiments were conducted for raising "Amager", "Slava", "Nomer pervyy", "Belorusskaya" cabbage varieties by the non-seedling method. Seed plantings along belts of perforated paper for protecting sprouts provided a harvest increase in comparison with planting by seedling from 7% ("Belorusskaya") to 23% ("Amager"),

PERIODICAL: Tr. Ural'skogo politekhn. in-ta, 1957, Nr 69, pp 148-150

ABSTRACT: To 1 cc of acid solution containing NH_4VO_3 powdered Zn is added to reduce the V^{5+} to V^{2+} (which is partially oxidized by atmospheric O_2 to V^{3+}). 1 or 2 drops of this solution are added to a ferric thiocyanate solution made by mixing 0.5 cc 0.005% ammonium ferric alum and 1-2 drops of 10% NH_4CNS solution. The reduction of Fe^{3+} to Fe^{2+} causes the Fe thiocyanate to become colorless. The sensitivity of the reaction is to within 20-30% at a maximum dilution of 1:12,500. It is inhibited by Ti, W, Mo, and NO_3^- .

rational line of behavior. It is assumed that such an automaton simulates certain functions of the brain which are associated with the learning of coordinated motor acts in animals and humans. A block diagram of an automaton that forms an abstract rational function of one variable is described. A self-learning plant ("Autodidact") controlled by an n-function automaton may learn to walk by coordinating the movements of its four legs; femoral and genual joints may be driven by reversible micromotors. The possibility of simulating conditional reflexes occurring in living organisms by the above automaton is discussed. "The author wishes to thank A. A. Zyuzin-Zinchenko for his help in creating the basis of the automaton, Professor N. A. Bernshteyn for his biological comments, and Professor V. S. Gurfinkel for his advice." TITLE: Automaton with a self-forming behavior algorithm

SOURCE: AN LatSSR. Institut elektroniki i vychislitel'noy tekhniki. Avtomatika i vychislitel'naya tekhnika, no. 10, 1965, 151-168

TOPIC TAGS: automaton, algorithm, behavior pattern

ABSTRACT: Block diagram and functions are described of a system that has a self-forming rational algorithm of behavior. A principle of rationalization of the composite algorithm that controls a purposeful random search of the best opportunity is used. The search method corresponds to R. Ashby's views on the adaptation of living organisms to their environment. The automaton accumulates its experience with various disturbances in the environment; with constant disturbances, an algorithm of behavior is worked out and recorded in a nonvolatile storage; when the essential parameters of the disturbance change, the automaton develops a new

the inverter is connected so that, irrespective of the polarity of input signals, only positive signals are applied to the input of the cathode follower. Input voltage S + 0 to \pm 100 V; input resistance in pulse-width modulation operation 15,000 ohms; amplitude of width modulated pulses 0 to \pm 100 V; duration of amplitude modulated pulses 0.01 to 50 sec. The above circuit was used in problems related to the design of automatic control systems. The circuit is actually the analog of a sampled-data controller and as such may be used in industry. There are 6 figures.

TITLE: Pulse-width and amplitude modulation circuit
for analog computers

PERIODICAL: Avtomatika i telemekhanika, v. 23, no. 12,
1962, 1675 - 1679

TEXT: The authors describe and analyze the operation
of a pulse width and amplitude modulation circuit, which in
conjunction with analog computers makes it possible to simulate
sampled data control systems. The circuit was developed at the
Institut avtomatiki Gosplana UkrSSR (Institute of Automation of
The State Planning Commission, UkrSSR). The circuit periodically
measures and converts a continuous input signal into pulses of
required width and amplitude. It consists of a bridge diode-
inverter, a cathode follower, an asymmetrical multivibrator and
an electronic time-relay. In pulse-width modulation operation

clusively within the pocket, constructed during preliminary exploration. This provides information regarding the extent of humus-sapropelic and oxidized coals. Remaining wells of detailed exploration and of dissection exploration are only sampled to determine the ash and water contents of the coals. Such selection of samples and distribution of full and abridged analyses allows the more important qualitative characteristics of the coals to be discovered, and their changes to be followed, with minimum loss of time and material. This order of collecting and testing samples ensures a more correct calculation of problems connected with the industrial assessment of coals. / Abstracter's note: Complete transcription. /

TEXT: The author analyzes the sampling results obtained in the exploration, by drilling, of Bogoslovskoye, Bolotanskoye, Korkinskoye, and Oroganskoye and near-Moscow deposits of brown coal, and concludes that collection of samples should be done in a differentiated manner: by sections or along coal sheet pockets. This order of collecting and testing samples fits up with geological exploration methods. All samples collected from main coal pockets are subjected to full technical analysis. In detailed exploration, the latter is carried out in walls of other pits, ex-

TITLE: Temperature-humidity stresses in an anisotropic ring, accounting for the dependence of the modulus of elasticity of the material on temperature and humidity

SOURCE: IVUZ. Mashinostroyeniye, no. 5, 1966, 26-30

TOPIC TAGS: elastic modulus, anisotropic medium

ABSTRACT: The author treats the axisymmetrical problem in polar coordinates for the determination of the temperaturo-humidity stresses during the cooling and drying of an anisotropic ring. Since the modulus of elasticity of the material depends on temperature and humidity, Hooke's law is applied in the differential rather than finite form. In place of the classical method of deriving integral-differential equations for the stresses, the problem is solved here by a preliminary establishment of the components of tensor for the "elementary stresses," whereas the components for the stress tensor are determined by integration on the basis of the change of temperature and humidity of the "elementary stresses" tensor. On the basis of the findings, it is concluded that where the temperaturo-humidity regime is variable, even very thin specimens cannot be preserved in the form of disks or rings without inadmissible stresses as long as the material is anisotropic. TITLE: The law of viscosity for solid bodies deformable in time

PERIODICAL: Referativnyy zhurnal. Fizika, no. 7, 1961, 203, abstract 7D93 ("Zap. Voronezhsk. s.-kh. in-ta", 1959, v. 28, no. 2, 385 - 387)

TEXT: It was experimentally established that creeping deformation for viscous solid body deformations is proportional to time at constant loads. The curve of variations of deformation rate has the vertical asymptote at the initial instant. In the course of time deformation rate decreases and, consequently, viscosity coefficient increases. The author proposes a general viscosity law and equation for deformations of solid amorphous bodies. Based on the concept of amorphous solid body, deformable in time, as heterogeneous system of amorphous fluidity particles and crystalline elastic particles, parallel coupled, the basic equation of deformation is derived. The differential equation obtained can be integrated in quadratures at any law of variation of stresses and strains in

Theory of Elastic Aftereffect in Wood.

PA - 3568

The function of the elastic aftereffect, which was obtained theoretically and agrees well with experimental results, was derived. The present theory discloses the characteristics upon which the process of elastic aftereffect depends, and it shows in what way this process can be artificially controlled in wood (increased or diminished). Theory of Elastic Aftereffect in Wood. (Teoriya uprugogo posle-deystviya drevesiny, Russian)

PERIODICAL:

Zhurnal Tekhn.Fiz. 1957, Vol 27, Nr 5, pp 1118-1120 (U.S.S.R.)

ABSTRACT:

The nature of the elastic aftereffect in wood (deformation in the course of time under the influence of a constant stress) can be explained by taking the submicrostructure and the chemical composition of the wood into account. The occurrence of elastic aftereffect in wood and its reversibility is due to the specific chemical composition and the heterogeneous structure of the wood, viz. by the existence of incrusts which are able to develop reversible elastic deformations.

The deformation of the elastic aftereffect has a diminishing character because:

- 1.) The elastic deformation of the incrusts takes place with a velocity which diminishes with time, and
- 2.) Stresses are with time transferred from the incrusts to the cellulose.

TITLE: An ignition system for free piston gas generators and free piston compressors.
Class 46, No. 177708

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1966, 116

TOPIC TAGS: gas compressor, compressor design, spark ignition, engine ignition

ABSTRACT: This Author Certificate presents an ignition system for free piston gas generators and free piston compressors, using spark discharges. The system includes a power supply unit, a blocking generator with a transformer and a negative feedback circuit using an RC, an ignition coil, an ignition coil circuit commutator, a discharge capacitor, a contractor, and electric spark plugs (see Fig. 1). The system improves the starting characteristics and reduces the wear of the spark plug electrodes. The system uses an auxiliary triode. The anode of the triode is connected with the load circuit of the blocking generator. The grid of the triode is connected with the secondary winding of the blocking generator transformer through

TITLE: The Permeability of Refractories to Gas at High Temperatures
(Gazopronitsayemost' ogneupornykh materialov pri vysokikh temperaturakh)

PERIODICAL: Trudy Ural'skogo politekhnicheskogo instituta, 1956, Nr 55,
pp 23-32

ABSTRACT: The permeability of specimens of Ural refractories to gas at 17, 250, 500 and 800° is determined. The determination is based on the standard OST/NKTP 4312 method, but instead of air N₂, heated in electric furnaces with Ni-Cr coils, is passed through the specimens. Molten Sn was poured on the periphery of the cartridge of the instrument. The determinations show that the permeability coefficient of gas-permeable refractories drops, reaching 12-16 percent permeability at room temperature, or in other words, varies approximately in inverse proportion to the viscosity of the gases.

PERIODICAL: Trudy Ural'skogo politekhnicheskogo instituta, 1956, Nr 55, pp 5-22

ABSTRACT: Data on the determination of the thermal conductivity, λ , of Dinas, fireclay, magnesite, chrome magnesite, and forsterite products of Ural plants are adduced. λ is determined by the method of stationary heat flow, employing flat specimens in standard brick shape with Ni-Cr heaters to an average temperature of 500-570°. It is established that $\lambda = 0.92 + 0.00067 t$ for thoroughly regenerated Dinas brick, specific gravity 2.36-2.45, where t is the mean temperature of the determination. Dinas brick of over 2.45 specific gravity, magnesite, and forsterite have negative temperature coefficients. Fireclay products have a positive temperature coefficient. The values of λ for these Ural products are in good agreement with those obtained by other investigators.
