PERIODICAL: Radio, 1958, Nr 11, p 44 (USSR)

ABSTRACT: A reader tells how to remove the stain from the screen of the "Rekord" television set, formed by the bright spot which appears in the middle of the screen as soon as the set is switched off. The power switch is switched over from the brightness control to the volume control, or else the set can be switched on and off with a two-pin plug without reducing the brightness.

TITLE: Conference on the Construction of Thermal Systems (Soveshchaniye po voprosam stroitel'stva teplovykh setey)

PERIODICAL: Teploenergetika, 1959, Nr 6, pp 90-91 (USSR)

ABSTRACT: An All-Union Conference on the construction of thermal systems was held in Moscow on the 11th - 13th March; it was convened by the Moscow Directorate of the Scientific-Technical Society of the Power Industry (District Heating Section). Representatives of the Acad.Sci. USSR, GOSSTROY USSR, GOSPLAN USSR, Councils of National Economy, design, operating, and erection organisations, and educational and research institutes participated in the conference. Thirteen reports were read and a number of communications were made. Ye.Ya. Sokolov read a report on 'The present state and future prospects of district heating'. The reports by Engineer S.Ye. Zakharenko of Mosteploset'stroy and Engineer A.A. Gerbko (Mospodzemstroy) dealt with the need for a review of methods of laying heating systems. Engineer A.I. Odnopozov (Glavleningradstroy)described the specially difficult conditions of laying heating systems in Leningrad. The report of Cand.Tech.Sci. A.A. Skvortsov of the All-Union Thermal-Technical Institute stressed the need to mechanise the construction of heating systems as far as possible. Engineer A.A. Lyamin of Mosenergoproyekt described the use of ready-made reinforced concrete ducts for the construction of large diameter heat supply pipes. Cand.Tech.Sci. V.P. Vitkuyev of ORGRES discussed costs of different methods of making heating systems. Engineer M.O. Shpeyer of Teploelektroproyekt discussed the mechanical strength of different types of heating supply system construction. The Conference noted the need to introduce new types of construction and thermal insulation. The Conference requested various responsible bodies to test a number of new types of construction. Other detailed recommendations were made.

$n_{\Delta\lambda} = 30$. Thus, for good images the total number of gradations of chromaticity $\mu \simeq \frac{n_{\Delta\lambda} n_{\Delta p}}{2} = 150$, and $\nu_0 = 4500$. However, for low color originals with clear gradations between colors (documents, maps), transmission of which by CFT presents the most promise, one can consider $\mu \simeq n_{\Delta\lambda}$; thus the color saturation in this case is inseparably connected with the color tone. In order to make possible the transmission also of images of good quality by CFT it is necessary to provide for a change of transmission speed. For this requirement the most satisfactory method of transmission is by signals of brightness (U_y), of color tone (U_λ), and saturation (U_p). Single color and low color images are transmitted by signals U_y and by the sum U_y and U_λ respectively. By reducing the transmission speed, 3 signals can be transmitted at once. The preparation of a model of the CFT equipment is reported, operating in the band 300--3400 hz on the principle of simultaneous transmission of the signals U_R, U_G, and U_B. 6 illustrations. TITLE: The possibilities of reducing the volume of information associated with the transmission of motionless color images

SOURCE: Ref. zh. Radiotekhnika i elektrosvyaz', Abs. 11B72

REF SOURCE: Tr. Nauchno-tekhn. konferentsii Leningrad. elektrotekhn. in-ta svyazi, vyp. 2, 1964, 17-25

TOPIC TAGS: colorimetric analysis, telecommunication, telegraphy, image contrast, image projection, information processing

ABSTRACT: The characteristics of color phototelegraphy (CFT) were investigated. It was pointed out that with CFT it is necessary to transmit color information concerning all the elements including also the fine elements (as distinct from color TV). The quantity of information I transmitted along a CFT channel is proportional to $\log_2 \nu_0$, where ν_0 is the number of colors which are distinguished both by brightness and by chromaticity. For motionless colored images $\nu_0 = m\mu$, where m and μ are the number of gradations of brightness and chromaticity respectively, in which $m \leq 25\text{-}30$; μ is determined by the gradations of the color current $n_{\Delta\lambda}$ and the color saturation $n_{\Delta p}$. For polygraphic hues $n_{\Delta p} = 10$. With the reproduction of high quality images

TOPIC TAGS: image converter, image projection, image tube, telephone equipment, telegraph equipment, phototelegraphic apparatus / Neva phototelegraphic apparatus

ABSTRACT: Experimental apparatus for the transmission of motionless images was described. The apparatus was developed on the basis of the commercial phototelegraphic apparatus "Neva." The kinematic unit of the apparatus remained unchanged, permitting the use of all existing synchronization systems for color reproduction. Two simple attachments were developed: a color separation unit for the transmitter and a color synthesizing unit for the receiver. These attachments can be easily mounted on the existing equipment and easily removed without disturbing the equipment for use in a single color system. The electrical channels of the standard apparatus undergo no alterations for the color reproduction and are not used. Special channels were developed. The positive results obtained with the intercity trans-

Some Studies in the Field of Electro-photography Applicable to Photo-telegraphy

Figure 2 shows how the thickness may be measured, and variations observed, by measuring the transparency of a film deposited on a glass plate. The results have been checked by a weighing method. The largest area of deposit which has been produced is 210 x 310 mm, but the quality of deposit is unacceptable above 100 x 120 mm. Generally speaking, the sensitivity of the film is comprable with that of ordinary photographic paper while the resolving power is determined by the particle size of the powder used in the developing process. The production of the latent potential image is described as well as the dry and wet methods of revealing it. The wet method is preferred, the liquid being either aviation benzine B-70 or petrol and the powder either talc or ordinary soot. Talc is used for contrast against the selenium plate and soot is preferred when paper prints are taken. One method of transferring the image to paper requires the paper to be charged and direct transfer of the particles, some of which are of resin. The image is fixed by subsequently heating it to 100 °C. The method preferred by the authors uses the adhesive properties of old, unexposed,

TITLE: Some Studies in the Field of Electro-photography Applicable to Photo-telegraphy (O nekotorykh rabotakh v oblasti elektrofotografii primentel'no k fototelegrafii)

PERIODICAL: Elektrosvyaz', 1958, Nr 5, pp 48 - 54 (USSR).

ABSTRACT: The material in this article has already been given before a plenary session of the commission on scientific photography and cinematography of the Ac.Sc. USSR and the scientific council of the NIKFI on January 31, 1957 and also before a conference of professors and lecturers of the LEIS on March 26, 1957. The chair of television of LEIS initiated work on this problem in 1956. The red modification of selenium was chosen as the sensitive material since it adheres to a wide range of base materials and, in particular, survives repeated flexing of the latter. The backing plate, of aluminium or duraluminium, is polished and oxidised by heating in air to 350 - 400 °C. The selenium is deposited by vacuum evaporation at a pressure of 10^{-4} to 10^{-5} mm from a hexagonal array of crucibles (pitch circle 70 mm) spaced 30 mm from the layer (finished size - 50 x 57 mm). The variation in film thickness is about 1%. From the point of view of both sensitivity and image quality, the optimum thickness is 2 - 5 μ.

A New Method of Manufacturing Strip and Dot Screens of Color Television Picture Tubes

potential of these sections, compared to the sections not exposed to illumination. A latent raster image is formed as a result of the exposure (lasting several seconds). A liquid (for example, gasoline) containing a suspension of a luminophor of a given color is used for developing this latent image. The particles of the luminophor become electrically charged by the stirring in the liquid and are attracted for this reason by the correspondingly charged sections of the semiconductor surface. Also a dry method of developing can be used, where the electrified luminophor powder is distributed over the surface of the charged semiconductor. Then all these operations are repeated for the luminophors of the remaining two colors. After the luminophors of all three colors have been applied, the selenium is eliminated by heating in air at $t \sim 250^{\circ}C$ and the luminophors are fixed (with water glass, for example). The method was checked experimentally when applying screens on the bottoms of metal-glass envelopes of 43ЛК2Б (43LK2B) type. There are 3 figures and 5 references.

TEXT: The new method of manufacturing three-color screens is based on the principle of electric photography. A transparent, conducting film (aluminum, stannic oxide, etc) is applied to the bottom of the tube from inside. The film is then covered by a thin layer of a photosensitive semiconductor (selenium for example). In respect to the conducting backing the surface of the semiconductor is charged to a potential of the order of some hundred volts. The image of a strip or dot raster is projected to this surface. The image corresponds to the structure of single-color elements of a three-color screen. The resistance of the surface of those semiconductor sections exposed to light decrease, as well as the

TITLE: Effect of impact acceleration on nitrogen metabolism in the rat brain

SOURCE: Voprosy meditsinskoy khimii, v. 12, no. 3, 1966, 262-265

TOPIC TAGS: impact acceleration, animal physiology, acceleration, nitrogen metabolism

ABSTRACT: Ninety white laboratory rats (weight 130—160 g) were used to determine the effect of impact acceleration on the metabolic processes of the brain. The concentrations of free ammonia, glutamine, glutamate, asparaginate, and γ-aminobutyric acid, as well as of labile and stable bound amide group proteins were investigated. The rats were subjected to impact accelerations (250—300 m/sec^2) in a chamber. These accelerations were arbitrarily designated as: weak (4—10 G), medium (11—24 G), and strong (>24 G). Three of the ten rats subjected to strong impact acceleration died. The rats were immersed in liquid air 15—20 min after exposure and the frozen brain, excluding the cerebellum, was removed. The meninges were removed, the brain was pulverized in liquid air, and was transferred in a powdery form for precipitation of

Orig Pub : Byul. Nauchno-tekhn. inform. Dal'nevost. n.-i. in-ta, s.kh., 1957, No 4, 9-11

Abstract : By crossing Ferrugineum A-54 x Dal'nevostochnaya, the Amur Experimental Station developed in 1950 the new varieties Erithrospermum 716, Erithrospermum 720, Erithrospermum 722 and Erithrospermum 725. By crossing Lutescens 62 x Dal'nevostochnaya - Lutescens 745 and Lutescens 750 were obtained. The new varieties surpass Dal'nevostochnaya in yield, resistance to stem rust, to smut and to damping off. -- A.F. Khlystova

"Lethal Complications Resulting from Majeptil Treatment."

Prague, Ceskoslovenska Psychiatrie, Vol 62, No 6, Dec 66, pp 410 - 412

Abstract [Authors' English summary modified]: 3 cases of death resulting from casual treatment with thioperazine (Majeptil) are described. The deaths occured 3 - 6 days after the beginning of the treatment. All the lethal cases started with a sudden rise in body temperature to 40°C without a somatic substantiation. Symptomatic therapy failed; in 1 case uremia was demonstrated shortly before death. No reason for the deaths were found. 2 Western, 1 Russian reference. (Manuscript received 21 May 65).

TITLE: Experimental Treatment of Bacterial Carriers Following Typhoid and Paratyphoid Fever.

ORIG. PUB.: Ceskosl. epidemiol., mikrobiol., imunol., 1958, 7, No.1, 57-65

ABSTRACT: 35 persons, who had recovered from typhoid or paratyphoid fever and were bacterial carriers, underwent various methods of treatment: immuno-therapy and treatment with antibiotics and sulfonamides along with immuno- and chemotherapy. Kammerfodre has reported success with penicillin-sulfathiazol therapy in some cases (Lancet, 1946, 251, 6319) and treatment with penicillin combined with streptomycin. It is noted that immuno-therapy re-

Odlanicki M. **Development Plan for the Skalne Podhale District.**

"Perspektywiczny plan zagospodarowania przestrzennego Skalnego Podhala". Przegląd Geodezyjny. No. 2, 1951, pp. 41–47, 6 figs.

This plan, based on a scientific analysis of natural and ethnographic factors, is intended to meet health, rest, cultural and tourist requirements of the world of workers. The plan, with Zakopane as the marshalling centre, embraces the sunny belt at the foot of the Polish Tatra mountain range between Witów and Bukowina. It provides for a suitable expansion of transport facilities and for the building of settlements to serve as health and rest centres, due consideration being given to the principles of protecting all natural features of the district and to the planning of farming and breeding.
