Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 8, No 5, Sep-Oct 69, pp 491-450.

Abstract [Authors' English summary modified]: Two different methods of combining TAB vaccine with the complex treatment of typhoid and paratyphoid fever were studied on 50 cases: the so-called classical method with progressive doses at one week intervals, and the "rapid" method at microintervals. Relapses occurred in 10.1 percent of cases with the first method and 4.87 percent with the second. The evolution of specific agglutinins was followed, with variable results recorded. One carrier was discovered among the 50 cases.

"Epizootological, Clinical and Therapeutic Prophylactic Studies on Sheep
and Pig Listeriosis"

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 16, No 1,
Mar 66, pp 50-59

Abstract: [Authors' English summary modified] A study of several outbreaks
of sheep listeriosis and one of swine listeriosis failed to locate common
precipitating factors. Bacteriologic tests of Oestrum ovis larvae collected
from 40 sheep in active listeriosis outbreaks and 11 sheep with clinically
confirmed cases were all negative. No abortions before or during the out-
breaks were observed in sheep, but they did occur in sows. All treatments
tried were ineffective for diseased sheep; mass treatment of the healthy
animals in a focus with a single large dose of penicillin, moldamin, strepto-
mycin or terramycin, however, immediately stopped the outbreak.

Title : Regularity of Stimulation Which Spreads Without Decre-
ment in the Motor Nerve Fiber of Crayfish Claw

Orig Pub : Soobshch. AN GruzSSR, 1957, 19, No 6, 723-730

Abstract : The investigations were conducted on a single nerve
fiber of crayfish. The nerve was taken with a length
of not less than 15 mm, i.e., the distance between the
stimulating and efferent electrodes was not less than
15 mm. As a source of stimulation, a relaxation stimu-
lator of direct current (impulses of triangular shape)
was employed. For alteration, 1 or 0.5% solution of

novocain was utilized. In cortical stimulations, the nerve fibers responded with maximum excitability, which did not change in further increase of the force of stimulation. In experiments on altered motor nerve of afferent muscle of the claw in the altered part (10 mm) the intensity of excitement decreased in accordance with increase of narcosis. However, this weakened impulse in passing through the narcotized part of the nerve again reached the normal level in entering into the intact part of the nerve. Consequently, motor and inhibitory nerve fibers without decrement.

TITLE: The functional formation of the myoneural junction in mammals in ontogenesis

SOURCE: AN GruzSSR. Institut fiziologii. Trudy, v. 14, 1965. Sovremennyye problemy deyatel'nosti i stroeniya tsentral'noy nervnoy sistemy (Present problems of the activity and structure of the central nervous system), 121-130

TOPIC TAGS: myoneural junction, CNS, ontogenesis, CNS ontogenesis, mammalian ontogenesis, muscle biopotential

ABSTRACT: Effects of motor nerve stimulation were studied in chloralose-narcotized cat embryos and kittens of various ages. Motor nerve stimulation was found to evoke muscle spike potentials and EPP as early as the 50th day of gestation. Traces of potentials evoked in the gastrocnemius and soleus muscles of 50-day embryos, and 7-hour, 10-hour, 1-day, 2-day, and 3-month-old kittens by single, paired, and rhythmic (various frequencies) stimuli are illustrated. On the basis of the data obtained it is concluded that the functional formation of the myoneural junction occurs during the prenatal period. Its further development is reflected in shrinkage of the chemoreceptive area of the muscle membrane and in increased secretory activity by the nerve endings.

Oniašvili, O. D. Application of a variational method to problems of vibrations and stability of a sloping shell. *Sootščeniya Akad. Nauk Gruz. SSR*, 10, 601-603 (1949). (Russian)

The solution of the problem of local stability and of vibrations of a sufficiently sloping shell (a sloping shell is an open shell of small curvatures) can be obtained from the integration of two simultaneous differential equations which determine the stress function and the normal displacements. These equations were given by V. Z. Vlasov [*Izvestiya Akad. Nauk SSSR, Otd. Tehn. Nauk* 1947, 27-52; these *Rev.* 10, 653]. In the case of harmonic vibrations the stress function which satisfies boundary conditions must also satisfy two variational equations. The Vlasov differential equations are difficult to solve in cases of variable stresses and curvatures. The above conditions do not affect the variational equations, whose solution can be reduced to a simple integration of preassigned functions. Such solution allows one to determine the natural frequency of vibrations of an initially stressed shell, a shell free from initial stresses, and also the critical load in the absence of body forces.

The author devotes this paper to the construction of the above-mentioned preassigned functions which would satisfy the boundary conditions. These functions are linear combinations of the fundamental functions used in the transverse vibrations of beams. The combinations depend on the boundary conditions and seven different cases of supports on the edges are investigated. None of the functions determined in this way is actually substituted in the variational equations; the author explains only the subsequent procedure. *T. Lutz* (Lexington, Ky.).

Oniašvili, O. D. On the theory of earthquake-proof sloping shells. *Sobščeniya Akad. Nauk Gruz. SSR* 11, 409-416 (1950). (Russian)

(Note: A sloping shell is an open shell of small curvatures.) This work is based on V. Z. Vlašov's theory given in his book, *General theory of shells and its applications in technology* [Gostelizdat, Moscow-Leningrad, 1949; these *Rev.* 11, 627]. The author considers shells which are rectangular when projected on a plane and are supported radially on all four edges. He limits himself to the following shapes: a shell of two different curvatures, a spherical shell, and a cylindrical shell; and each type is dealt with separately. The influence of an earthquake is reduced to a horizontal load acting on the entire surface of a shell. The author uses the momentless theory, and also the theory which takes bending into account. It is convenient to express the stresses in a form of double trigonometric series, when the supports are radial. The main task in this boundary-value problem is to determine the coefficients of these series. Although the paper devotes most of its space to the construction of the series and the determination of the coefficients, the author refers to a previous (unavailable) publication [*Trudy Inst. Stroit. Dela Akad. Nauk Gruz. n. SSR* 3 (1950)] for a more detailed study of it. *T. Lever.*

Translation from: Referativnyy zhurnal Mekhanika 1957, No. 2, p. 101 (USSR)

AUTHOR: Onyashvili, O. D.

TITLE: Approximate Solution of Some Problems of the Nonlinear Theory of Shells. (Priblizhennoye resheniye nekotorykh zadach nelineynoy teorii obolochek)

PERIODICAL: Trudy Inst. stroit. dela AN GruzSSR 1955, Vol. 5, pp. 11-20

ABSTRACT: The flexure, vibration, and stability of elastic shallow shells having a rectangular planform and freely supported at the ends is examined. It is assumed the principal curvatures of the median surface of the shell are constant quantities prior to deformation. The problem is reduced to the well-known nonlinear equations relative to the stress $\sigma_{\alpha\beta}$ and the flexure function w . The solution is sought by means of integration of these equations according to Bubnov's method, where

$$f = \sum_{mn} A_{mn} f_{mn} \quad w = \sum_{mn} B_{mn} w_{mn} \quad Z = \sum_{mn} C_{mn} Z_{mn} \quad (1)$$

Card 1 of 2 $f_{mn} = \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} \quad w_{mn} = \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} \quad Z_{mn} = \sin \frac{m\pi x}{a} \sin \frac{n\pi y}{b} \quad m, n = 1, 2, 3, \dots$

124-57-1-1176

Approximate Solution of Some Problems of the Non-linear Theory

Here Z is the normal surface load, a is the length, and b the width of the panel. Substituting (2) in the equation of equilibrium, the author obtained the erroneous equations (3) which yield two relationships connecting the corresponding quantities A_{mn} and B_{mn} for the selected quantities m and n . In reality Eq. (3) is valid only in the event that the series in (2) comprise but one term each. Later on the author does limit himself to that first approximation. He set for himself the problem of determining the effect on nonlinear factors (the so-called secondary effect) upon the amplitude of the flexure, the frequency of the free vibrations, and the critical loading, and then proceeds to establish such small degrees of curvature (shallow camber) that even the linear theory would be accurate to within 5 percent. We note that the solution of the nonlinear problem by means of the first approximation itself may yield an error in excess of 5 percent. Computations are shown for several reinforced-concrete roofings of spherical and cylindrical shape, also some having a double curvature. It is shown that the linear theory underestimates the magnitude of the flexure and overrates the magnitude of the critical external pressure and the frequency of the free vibrations.

TITLE: The Evaluation of the Boundary Effect in the Static Calculation of Spherical Shells. (Otsenka granichnogo effekta pri staticheskom raschete sfericheskikh obolochek)

PERIODICAL: Tr. In-ta stroit. dela AN GruzSSR, 1955, Vol. 5, pp. 27-39.

ABSTRACT: The authors submit an approximate evaluation of the state of stress in a shallow spherical shell that is rectangular in plan view with relation to the character of the boundary conditions. By means of determining the shallow shell equation of the engineering moment method and the help of the variational method it is proved that the influence of the boundary effect increases with an increase in the slowness of the shell and attains a maximum in the limit case of a thin flat plate.

Book 804. Onishvili, O. D. Certain dynamic problems in the theory of shells (in Russian). Moscow, Academy of Science, 1957, 195 pp. 9 rubles.

To the best of this reviewer's knowledge this book represents the first book on shell theory to be devoted almost exclusively to the field of shallow shells. In the first chapter, author presents the well-known differential equations governing the behavior of thin elastic shells originally presented by Vlasov in 1944. In the second chapter he presents the application of these equations to the free vibrations of a cylindrical shell having simply supported ends. This is followed by a detailed treatment of the free vibrations of an arbitrary shallow shell, provided only that the Gaussian curvature is everywhere positive. Next the natural frequencies of a thin shallow spherical segment are determined.

The next chapter introduces variational methods, and several problems involving shallow shells having specified principal curvatures at all points together with boundaries having a rectangular projection upon the shell base plane are considered. Both the internal forces as well as natural frequencies are determined. A number of conditions of edge fixity are considered. Problems involving roof shells in the form of continuous shallow cylindrical panels subject to uniform load are treated.

The fourth chapter is devoted to forced vibrations of shallow shells. Cylindrical panels subject to pulsating axial forces as well as spherical shells subject to pulsating concentrated forces are treated in detail.

3
3

11/2

ONJASHVILI, O.D.

The fifth chapter investigates the effects of the inclusion of nonlinear terms in the governing differential equations, and the deformations of a cylindrical panel subject to uniform normal load are determined. It is shown that, for sufficiently large deflections, the linear theory may be as much as 16% in error.

The sixth chapter treats the deformations present in shallow shells having rectangular base projections and subject to combined normal load and edge loadings in the plane of the shell middle surface. Application of these results to mofs composed of continuous prismatic segments such that the cross section appears as a series of broken-line segments is discussed in detail.

The book concludes with a seventh chapter devoted to experimental verification of these results. Strain measurements indicated by electric strain-gage techniques as well as experimentally determined natural frequencies are shown to be in excellent agreement with the predictions of theory.

Much of the work in this book has been presented in the form of numerous papers by Prof. Onjashvili during the past six or seven years. In the book he has skillfully woven together his own contributions as well as the work of many other investigators to form an excellent treatise on shallow-shell theory. The bibliography lists 71 papers in several Western languages as well as Russian.

Onicescu, Octav, et Mihoc, Gh. Un cas d'exception dans la theorie des chaines de Markoff. Acad. Roum. Bull. Sect. Sci. 24, 401-408 (1943).

Let x_1, x_2, \dots be the random variables of a Markov chain with stationary transition probabilities. In earlier papers [Bull. Math. Soc. Roumaine Sci. 41, 99-116 (1939); Mathematica, Cluj 16, 13-43 (1940); these Rev. 1, 342] on the distribution of $\sum_{i=1}^n x_i$ for large n , studied by means of characteristic functions, the authors were forced to appeal to other methods to handle a certain degenerate case. They now show, deferring the details to a later paper, how their method can be used in all cases. [For a complete treatment of this problem by a different method see W. Dooblin, Bull. Math. Soc. Roumaine Sci. 39, no. 2, 3-61 (1937).] J. L. Doob (Urbana, Ill.).

Onicescu, O.

Onicescu, O. Sur le théorème fondamental de l'algèbre.

Mathematica, Timisoara 22, 208-214 (1946).

Proof of the fundamental theorem in the form "a polynomial with real coefficients and of even degree has a real quadratic factor," avoiding the use of complex numbers. The work starts with a lemma (which may be generalized considerably) of which the proof is simple; necessary and sufficient conditions for $a_0x^{2m+2} + \dots + a_{2m+2}$ to have a quadratic factor $x^2 - c$ are identical with necessary and sufficient conditions for $a_0x^{2m+1} + a_1x^{2m} + \dots + a_{2m}x + a_{2m+1}$ and $a_1x^{2m} + a_2x^{2m-1} + \dots + a_{2m-1}x + a_{2m}$ to have a common factor $x - b$. By applying this lemma and using purely algebraic reasoning, it is proved that a polynomial of degree $2n$ with real coefficients has a real quadratic factor. From this point on, methods of analysis are applied (mapping of one real plane on to another real plane by an algebraic function and topological and continuity considerations).

ONICESCU, O.

1946

Onicescu, O. Les séries de structures. Acad. Roum. Bull. Sect. Sci. 26, 303-310 (1946).

Let x_1, x_2, \dots be mutually independent nonnegative random variables. The author apparently wishes to prove, in the language of "binary structures," that $\sum x_n$ converges in distribution if and only if the infinite product $\prod \Pr \{x_n = 0\}$ is convergent. The general theorem [which is false] is derived from the special [true] theorem for the case when x_n only takes on the values 0 and 1. J. L. Doob.

Onigescu, O. Integrals singuliere si reprezentarea
 functiilor liniare. Rev. Univ. "C. I. Parhon"
 Iasi, Ser. Sti. No. 1 (1953), no. 2,
 pp. 15-16. (Romanian. Russian and French summaries)

The author proves that if f is continuous on $[a, b]$ and
 if F is a monotone function defined on the whole line with
 total increase one, then

$$\lim_{\alpha \rightarrow 0} \int_a^b f(x) dF\left(\frac{x-\xi}{\alpha}\right) = \begin{cases} 0 & \text{if } \xi < a \text{ or } \xi > b, \\ f(\xi) & \text{if } a < \xi < b. \end{cases}$$

The result is extended to functions of bounded variation
 and to n dimensions. Combined with Helly's theorem on
 limits of functions of bounded variation this leads to a
 proof of the F. Riesz theorem on representation of a
 linear functional on the space of continuous functions on
 $[a, b]$.

Given an interval I in Euclidean n -space, the author constructs on the product $I \times I$ a sequence of density functions whose total weight is concentrated nearer the diagonal with increasing n . With these functions he gives short proofs that (1) each additive bounded variation interval function on I is the "weak" limit of such functions defined from continuous density functions, and (2) each linear functional on $C(I)$ is representable as an integral with respect to such a function (Riesz theorem).

Onicescu, O. L'application de quelques théorèmes de calcul de probabilités à la statistique stellaire. Rev. Univ. "C. I. Parhon" Politehn. Bucuresti, Ser. Sti. Nat. 4 (1955), no. 8, 35-38. (Romanian, Russian and French summaries)

Let X stand for a directly unobservable characteristic of a star (e.g., absolute magnitude) and Z for the corresponding observable apparent characteristic of the same star (e.g., apparent magnitude) so that X is a known function $F(Z, R)$ of Z and of the star's distance R . It is assumed that X is a random variable with a probability density $\Psi(x)$, independent of R . Also it is assumed that, for a specified category of stars for which the observations of Z are possible, R is a random variable with a probability density $r^2 D(r)$. Then the probability density of Z , say $\psi(z)$, is given by the familiar equation

$$(1) \quad \psi(z) = \int_0^{\infty} r^2 D(r) \Psi(F(z, r)) (dF/dz) dr.$$

The author notices that for three particular interpretations of X and Z , namely for absolute and apparent luminosity, for absolute and apparent magnitude and for transversal velocity and proper motion, there exist transformations

Onicescu, O. La répartition limite des sommes de variables aléatoires d'un processus Markov fini, homogène et continu. An. Univ. "C. I. Parhon" București. Ser. Sti. Nat. 5 (1956), no. 12, 9-12. (Romanian. French and Russian summaries) ² 1-F/W

In this paper the author gives various results concerning the homogeneous Markoff chains with a finite number of states and continuous parameter. In particular, he shows that the method introduced by himself and by G. Mihoc [Mathematica Cluj 16 (1940), 13-43; MR 1, 342] for the study of the asymptotic properties of the partial sums of a sequence of random variables constituting a Markoff chain with a finite number of states may be adapted to the continuous case. Estimations similar to those obtained in the discrete case are also given.
