Card 1/1

Author : A. I. Oparin, Academician

Title : The origin of life

Periodical : Moscow 1 Znaniye' 21/A, 25-27, April, 1954

Abstract : A brief history of the theories on the origin of life is given, including the struggle between idealism and materialism. The author recounts the cosmic developments before life appeared and finds a milestone in the appearance of protein. Details of the processes of catabolism and anabolism are given and the conclusion is reached that the processes which distinguish organic matter from inorganic can be produced artificially. Diagram, Photographs.

no. 2, Jan. 11, 1954, p. 305-308.
Activities of invertases obtained from yeast, mold fungi, and
higher plants compared by investigation of behavior with
regard to β -diethylfructoside, β -ethylfructoside, and alkyl-
fructoside. Photographs. 10 ref.

OPARIN, A.I.

Localization of enzymes in the cells of *Endomyces magnusii* by means of ultrasonic waves. A. I. Oparin, N. S. Gel'man, and I. E. Pypina (A. N. Bakulev, B. V. Kurnikov, and B. N. Blonhys). Acad. Sci. U.S.S.R., Moscow. Doklady Akad. Nauk S.S.R. 96, 573-6 (1954). Culture suspensions of *E. magnusii* were subjected to ultrasonic waves at 740 kc. which, in a few min., led to release of intracellular matter into the suspension medium (H_2O). The treatment lowered both respiration and fermentation ability of the organisms; the former by 88-90% in 18 min. The enzymes themselves dissolved in the yeast liquor are not affected by the treatment. When the filtered solids were comod, and dried with Me_2CO-Et_2O , the invertase activity was found to be very high as was the dehydrogenase activity. Cytochrome oxidase is sensitive to ultrasound. G. M. Kosolapoff.

Title : Effect of ultrasonic waves on yeast invertase

Periodical : Dok. AN SSSR 99/3, 423-426, Nov 21, 1954

Abstract : The change in the activity of a ferment, after being exposed to ultrasonic waves in an aqueous medium and in the presence of methyl alcohol, was investigated. Experimental data obtained indicate that the effect of ultrasonic waves on the invertase is connected first of all with the reaction of the ferment with the products of water molecule cleavage. The effect of polymannan contents in the albumin-carbohydrate complex of the invertase, on the stability of the ferment, is elucidated. Ten references: 3-USA; 6-USSR and 1-Swiss (1950-1954). U S S R .

Effect of the nutrient medium on the carbohydrate content of yeast and their fermentative ability. A. I. Oparin, N. B. Gel'man, and I. G. Tikhonova. Dokl. Akad. Nauk S.S.R. 99, 600-6 (1944).
S. cerevisiae, S. pombe, and S. paradoxus were transferred from sucrose media to 24 hr. media with yeast extract and glucose, then into Ryder medium with yeast extract and glucose. Both were grown for 24 hrs. at 30° in this medium, after which the centrifuged and washed cells were placed in various media, following which they were exposed to microzymes (cf. C.A. 38, 13756e) for estimation of amylase activity. S. cerevisiae increases its invertase activity some 20-fold after long existence in a sucrose rich medium; such yeast shows a lowered content of total carbohydrates and the result is similar to that obtained by growth in a malic acid medium. S. paradoxus failed to develop this low content of carbohydrates after similar treatment. Adaptation to a carbohydrate-rich medium generally lowers the content of sugars that are not in 10% $\text{C}_6\text{H}_5\text{CO}_2\text{H}$. S. pombe grows in sucrose medium shows an increase of mannose and glucose content, with a slight drop of glycogen. S. paradoxus on the other hand shows a rise in glycogen, no change in glucose, and a drop of mannose content. Thus the rate of carbohydrate synthesis by yeast is affected by the source of carbohydrate nutrition. G. M. Koenig

U.S.S.R.

Nature and the mechanism of action of yeast invertase.
A. I. Oparin and M. S. Bardinskaya (A. N. Bakh Inst. Biokhimi., Acad. Sci. U.S.S.R., Moscow). *Izv. Akad. Nauk S.S.R., Ser. Biol.* 1953, No. 2, 3-7.—A specimen of the invertase purified by adsorption on $\text{Ca}_3(\text{PO}_4)_2$ (the specimen contained N 4-5 and carbohydrates 70% and had an absorption max. at 265-75 m μ) was subjected to paper electrophoresis with C electrodes at various pH. At pH 3.2-4.7 in acetate or glycine buffer the enzymes migrated to the anode, as shown by detm. of activity on sections of the migrate. The main protein fraction contained the invertase activity and catalyzed formation of alkyl fructosides but had no maltase activity. At pH 3.25 there was detected a 2nd migration band which also catalyzed the formation of alkyl fructosides and had a greater activity than the main fraction. Migration at pH 3.25-3.8 resulted in accumulation of all carbohydrate content in this 2nd fraction, the main fraction being devoid of carbohydrates. Among the carbohydrates, mannose was found. Thus the greater activity existed in the protein-carbohydrate complex. The invertase activity was retained in electrophoresis at pH 6.8. If the sepd. fractions were eluted with 0.1N NaOH and 1:1 MeOH and the eluates were examined photometrically, the activity was still retained in the 2 fractions.

Abstract : Lev Ivanovich Kursanov, Head of the Chair of Lower Plants of the Biological-Soil Faculty, died on 11 December 1954 at the age of 78. Kursanov joined the faculty of the university when he graduated in 1900. His specialty was the study of algae and fungi. His doctor's dissertation on "Morphological and Cytological Research on the Uredineae Group" which he defended in 1915 was very exhaustive and earned him a place among the foremost Russian mycologists. He became head of the Chair of Lower Plants when it was created in 1918 and occupied that position until his death. He worked on phytopathology, mycotic rots of wood, and antibiotics. He was active in the activities of the University. He received three awards from the government.

right state and activity of invertase and maltrase in some species of the *Saccharomyces* A. I. Oparin, N. S. Golovkin, and I. G. Zhilina. Biochimica, 1938, 10, no. 3, 571-575. Referral 2A, 1970, 1870, 2-347, 169, #4798. In some forms of yeast invertase may occur in an inactive state. It may be revealed after columns treatment of cells or after the action of ultrasonic waves. *S. cerevisiae* (L.) which does not ferment maltose containing maltose in the active state. The maltase is found within the cell in its proenzyme, while invertase is localized to the membrane. Under long continued cultivation on media with sucrose and maltose *S. cerevisiae* and *S. pombe* acquire the capacity to ferment these disaccharides. In the process of adaptation there occurs a quantitative increase in the content of ferment in the cell. Some yeast organisms acquire the capacity to ferment sucrose but contain no invertase in the cells. The splitting of sucrose in this case is accomplished by maltase. The adaptation of the organism to the utilization of sucrose is accomplished by increasing the permeability of the cell. (Russian)

11) Coacervates and enzymes. Protein-carbohydrate coacervates and α -amylase. A. I. Oparin, T. N. Evrinova, T. A. Shubert, and M. V. Nekyina. *Doklady Akad. Nauk S.S.R.* 104, 581-3 (1955); *C. A.* 46, 9640e. — Mixtures of 10% starch solution, protamine sulfate, gelatin, and α -amylase were made up at 50° and adjusted to pH 7, to form the coacervate droplets which were incubated at 50°; periodic determinations of starch were made with i-KI. Thus, there was shown the progression of formation of amylopectin, amylose, dextrin, and schrodextrin. Starch *per se* is more rapidly attacked by amylase than is the coacervate. At pH 5.2-5.2 gelatin and protamine definitely retard amylase action on starch. C. M. Kovalapoff

Influence of p-Methyl Fluorination by plant invertase
Oparin, M. B., Bortnikova, and K. D. Pyrolysis of p-methyl fluorinated sucrose. Zvezdy Akad. Nauk SSSR 1964, 580-5 (1965).
In the course of the study of the matter of leaf juice of various trees and bushes collected in the spring, show the presence of very active invertase in aqueous; in aqueous EtOH the system showed active synthesis of 6-methyl-fructose, which was apparently shown by opening link. These invertases acting on sucrose at pH 4.7 gave some synthesis of methyl fructoside if the system contained MeOH, EtOH, PyOH, BuOH, or $\text{Pr}_2\text{CH}_2\text{OH}$; with AmOH the reaction was very weak, while with $\text{C}_6\text{H}_5\text{OH}$ it was absent. OPARIN, A. I.

✓ 1038. Influence of change of structure in bacterial protoplasts upon respiration and the uptake of labelled glycine. A. I. Oparin, N. S. Gelman, and I. G. Zhukova. Dokl. Akad. Nauk. S.S.R., 1955, 103, 1036-1039; Referei. Zh. biol. Khim., 1956, Abstr. No. 12463. — It was found that a decrease in the concn. of sucrose in the reaction mixtures during action upon the *Micrococcus lysodeikticus* cells of lysozyme leads to a disintegration of the protoplasts liberated as a result of the dissolving of the cell envelopes. The respiration of the protoplasts is suppressed less during the rapid disturbance of their structure (in lysis in a mere concn. sol. of sucrose) than is the uptake of labelled ^{14}C on the carboxyl group of glycine. With greater disintegration of protoplasts the respiratory coefficient falls from 0.85 to 0.50, which indicates a disturbance of certain links in the respiratory process. The total nitrogen and nucleic phosphorus content of the protoplasts diminished when the disintegration of their structure was very great. The output of protoplasts when the disintegration of their structure was considerable fell to 50% of all cells. (Russian)

Complex formation in the system serum albumin-gum arabic. A. I. Oparin, M. S. Bardinskaya, S. G. Melik-Sarkisyan, and K. B. Serel'novskaya (A. N. Bakh Biochem. Inst., Moscow). Doklady Akad. Nauk S.S.R. 198, 1125-7 (1971).--The moving boundary method in a Tiselius app. was used to study the complex formation in a system composed of serum albumin and gum arabic, at pH 6.9, in acetate-barbital buffer in the presence of 1% sucrose. In all cases 3 electrophoretic peaks were observed; one of these was that produced by the free excess polysaccharide; the others may be caused by a pair of complexes. One of the peaks had a mobility comparable to that of the albumin, the other had a slightly higher mobility. Hydrolysis of

the migrated material gave monosaccharides characteristic of gum arabic and the complexes themselves apparently contained about 14% carbohydrate and 86% protein component.
