Matching of complex resistance ...

where $\beta = \frac{2\pi}{\lambda}$ is the wave number, $\rho(x) = \frac{1}{2} \frac{d}{dx} \ln Z(x)$ the function of the internal reflections; $Z(x)$ the characteristic wave impedance of the line in section x . If $F^2 \ll 1$ then for the boundary conditions $x = 0; \bar{\Gamma} = \bar{\Gamma}_H; x = l; \bar{\Gamma} = 0$ the following expression is obtained:

$$\bar{\Gamma}_n = \Gamma_n e^{i\beta n} = - \int_0^l \rho(x) e^{i\beta x} dx. \quad (5),$$

l denotes the length of the inhomogeneous line section. Using a Fourier transformation with boundary conditions yields

$$-\Gamma_n \cos \varphi_n - i \Gamma_n \sin \varphi_n = \int_0^l \rho(x) \cos 2\beta x dx + i \int_0^l \rho(x) \sin 2\beta x dx. \quad (6)$$

If a relative mismatching $a = \frac{\beta - \beta_0}{\beta_0}$ with $\beta_0 = \frac{2\pi}{\lambda_0}$ and λ_0 equal to the wave length which corresponds to the center of the matched range, is introduced and if

$$F_1 = -\Gamma_n \cos \varphi_n; F_2 = -\Gamma_n \sin \varphi_n. \quad (8)$$

Card 2/8

89131

S/108/61/016/002/004/011
B107/B212

Matching of complex resistance ...

then the following equations are obtained:

and

$$F_1(\alpha) = \int_0^l p(x) \cos \frac{4\pi x(1+\alpha)}{l} dx \quad (9)$$

$$F_2(\alpha) = \int_0^l p(x) \sin \frac{4\pi x(1+\alpha)}{l} dx \quad (10)$$

where $l = X\lambda_0$; K is a positive number. A variable is introduced:

$n = 4X(1 + \alpha)$. The relative mismatching will fluctuate in the matching range between $-\alpha_{\max} \leq \alpha \leq \alpha_{\max}$. Certain values of α correspond to integer n . If $\alpha = 0$, $n_0 = 4X$. Mismatching $\Delta\alpha$ to the next integer that differs from n_0 by one is given as $\Delta\alpha = \frac{1}{4X} = \frac{\lambda_0}{4l}$. The set of integers n in a given matching range is only a function of the transformer length.

Substituting n yields:
Card 3/8

69131

Matching of complex resistance...

S/108/61/016/002/004/011
B107/B212

and

$$F_1(n) = \int_0^l p(x) \cos \frac{n\pi}{l} x dx, \quad (14)$$

and for $F_2(n)$

$$F_2(n) = \int_0^l p(x) \sin \frac{n\pi}{l} x dx, \quad (15),$$

$$p(x) = \frac{2}{l} \sum_n \left(X_n \cos \frac{n\pi}{l} x + Y_n \sin \frac{n\pi}{l} x \right) \quad (16).$$

In order to determine the coefficients X_n and Y_n , (16) is substituted into (9) and integrated for fixed values of a . A system of $2N$ equations is obtained with unknowns X_n and Y_n . N is the set of integer n in the matching range. For $N = 3$ is

TITLE: Dependence of adsorptive catalytic desulfurisation of diesel fuel on a catalyst surface

SOURCE: AN SSSR. Bashkirskiy filial. Khimiya serraorganicheskikh soedinenii,
soderzhashchikh sva v naftyakh i nefteproduktakh, v. 7, 1964, 200-204

TOPIC TAGS: desulfurisation, catalyst, adsorption, diesel fuel, surface active agent, sulfur, hydrocarbon/ silica gel, KSM silica gel

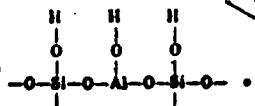

ABSTRACT: The relative activities of various catalytic agents and adsorbents in adsorptive-catalytic purification of diesel fuels from organic sulfur compounds were studied experimentally. The specific adsorption surfaces and their pore sizes were determined by the adsorption isotherms of various hydrocarbons and organic acids. The adsorbent-catalysts were mostly aluminosilicates, an alumogel, a silica gel, and bauxite. For synthetic as well as natural aluminosilicates, the specific desulfurization rate remained constant. The specific activity of bauxite was high, but that of the alumogel and the silica gel were low. It was shown that

Cont 1/2

L 42107-65

ACCESSION NR: A15008634

the major role played by the aluminosilicate catalysts in diesel fuel desulfurization could be attributed to the complex

During desulfurization, coke and other organic sulfur compounds were deposited on the surface of the catalyst and reduced the effective catalytic area. This requires special regeneration of the contaminated surfaces. Orig. art. has: 2 tables, 1 figure, and 1 formula.

TITLE: Coaxial Resonator. Class 21, No. 176610

SOURCE: Byulleten' inobreteniy i tovarnykh znakov, no. 23, 1965, 25-26

TOPIC TAGS: resonator, coaxial resonator, capacitor, transformer, electron tube

ABSTRACT: A coaxial resonator with a tuner in the form of a variable capacitor is described. To increase the tuning range of the resonator, shown in the accompanying figures, both the movable and the fixed plates of the capacitor are placed perpendicularly to the resonator axis at a distance from its short-circuited end of less than one fourth of the maximum wavelength. The fixed plates are rigidly mounted on one of the resonator tubes (either inner or outer) and the movable

TITLE: Temperature-velocity factor while pressing aluminum alloys

CITED SOURCE: Tr. N.-i i proyektno-konstrukt. in-ta gorn. i obogatit. mashinostr.,
sb. 2, 1960 (1961), 113-133 27

TOPIC TAGS: pressing aluminum alloy, temperature-velocity factor, drawing degree,
pressed rod, duralumin, crack

TRANSLATION: Factors influencing thermal effect of deformation were investigated.
A method of approximate calculation of thermal effect while pressing aluminum
alloys is presented. Test methods are described for determining the effect of the
degree of drawing on the thermal effect of deformation, temperature of the pressed
billet and the container and the pressure speed during hot pressing of D-1 duralu-
min. Tests were carried out on a 1,000 t hydraulic press. Diameter of the con-
tainer bushing was 115 mm. The drawing degree (ratio of cross section area of
initial bar to the cross section area of the pressed product) was 10.2, 30 and 46.

2

During tests the following were recorded: the force of pressing per move, surface temperature of the pressed rod at its exit from the matrix eye, and of the matrix temperature. Study of the quality of the pressed rods and analysis of their microstructure were also carried out. It was established that during pressing aluminum alloys of "duralumin" type the thermal effect is very high and may cause a 100° and more warming up of metal. At increasing speed of pressing the temperature of the metal piece constantly rises then from the front toward the rear end and from the center toward the periphery. Irrespective of pressing conditions (initial alloy temperature, container temperature, elongation degree and deformation speed) cracks on the pressed rod appear at a certain surface temperature of the product (for products made of D-1 and D-10 alloys at 480 to 490°); pressing of rods made of D-1 alloy at high running speeds (of the order of 50 m/min and more) at ordinary conditions leads to overheating of peripheral layers. During this time overheating appears later than cracks on the product. It often accompanies metal cracking but is not its primary cause. Fifteen figures, 2 references. S. Kolesnikov.

TITLE: Method of Extrusion of Hard Aluminium Alloys and
Other Low-plasticity Metals and Alloys
(Soviet Patent No. 129616, Class 7b, 10, Valid from
June 20, 1959, Published November 5, 1960)

PERIODICAL: Hutnické listy, 1961, No. 4, p. 290

TEXT: In order to increase the forming speed during extrusion of sections, an extrusion die with two zones was used, a compression zone and a sizing zone, which are separated by a cavity filled with lead, graphite or another substance which has a lubricating effect. This lubricant ensures maintaining in the extrusion blank a state of stress, without producing tensile stresses, and a high surface quality. The idea is demonstrated by a sketch, Fig. 5, where: 1 - the metal to be extruded; 2 - entry (compression) zone; 3 - extrusion die; 4 - sizing zone; 5 - cavity; 6 - lubricant; 7 - infeed of the lubricant; 8 - piston; 9 - rod.

TITLE: On the calculation of force in pressing aluminum alloy rods

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Tsvetnaya metallurgiya,
no. 5, 1962, 145 - 155

TEXT: In order to develop methods of determining the force in pressure working of metals, the authors attempted the derivation of a formula to calculate the force in rod pressing, using direct methods of variation calculus. Force and pressure are calculated with the use of a rough, approximate metal flow diagram (Fig 1) where the container is divided into 3 sections, the velocity field is kinematically possible, and value "a" is the depth of deformation spread. The following simplified formula for the necessary force in pressing rods is derived:

$$\frac{P_c}{2T_s} = 1.1 + 1.15 \lg \lambda + 2 \sqrt{\frac{0.4\lambda + 0.6}{\lambda}} - 1 + 2.8 \frac{L}{D}; \quad (6)$$

λ is the extrusion. The calculated data were experimentally checked and their

TITLE: New testing machines

PERIODICAL: Priborostroyeniye, no. 8, 1962, 24 - 25

TEXT: The article reviews the following new testing machines: Tensile testing machines PT-5 (RT-5) and PPT-1.5 (RPT-1.5) for testing at temperatures of 1100 and 500°C respectively, hydraulic machine ГМС-15 (GMS-15) for expansion and compression tests, machine УПК-4 (UPK-4) and МВП-10000 (MVP-10000) for fatigue tests, machine УКИТ-6 (UKIT-6) for endurance limit tests, machine КМ-50 (KM-50) for torsion tests, machine П-500 (P-500) for spring testing, instrument ПТТ-100 (PTT-100) for tensile yield point tests of tubing, instrument ПТТ-1250 (PTT-1250) for standard thermal activity test of bi-metals at a temperature range of 20 - 500°C. The basic working characteristics of the machines are given and methods of application described in general. There are 1 table and 3 figures.

PHASE I BOOK EXPLOITATION

SOV/3783

Andreyev, Vladimir Aleksandrovich, Vasiliy Aleksandrovich Zvorykin, Lev Andreyevich Konorov, Sergey Sergeyevich Len'kov, Sergey Timofeyevich Orlov, Vladimir Semenovich Semchukov, and Vladimir Sergeyevich Tarkhov

Raschet i postroyeniye konturov samoleta na plaze (Calculation and Construction of Aircraft Contour Lines With Templates) Moscow, Oborongiz, 1960. 490 p. Errata slip inserted. 2,200 copies printed.

Reviewer: S.S. Bekin, Engineer; Ed. (Title page): S.S. Len'kova, Candidate of Technical Sciences; Ed. (Inside book): V.I. Tikhonov, Engineer; Ed. of Publishing House: M.F. Bogomolova; Tech. Ed.: V.P. Rozhin; Managing Ed.: S.D. Krasil'nikov, Engineer.

PURPOSE: This book is intended for designers and technicians in experimental design offices, lofting shops, and production-development sections of aviation factories. It may also be used by students of schools of higher technical education and teknikums specializing in aircraft construction.

COVERAGE: The book examines the principles of the lofting method of aircraft construction, the application of these principles to the design of surfaces of aircraft assemblies, and the procedures for making theoretical and constructional templates.

Card 1/14

Calculation and Construction (Cont.)

SOV/3783

The lofting method and the method used in general machine construction are analytically compared. Tolerances used in lofting, some aspects of surface calculation, recommendations for the application of surface calculations to the design of new aircraft, and the construction of aircraft parts and the equipment used for this purpose are discussed. The book is based on experience in this field gained by the authors, by factories, and by scientific research institutes and is claimed to be the first such publication in this field. Part I was written by L.A. Konorov, V.S. Semchukov, and S.S. Len'kov; Part II, by V.A. Andreyev, S.S. Len'kov, and V.S. Semchukov; Parts III and IV, by V.S. Tarkhov; and Part V, by S.T. Orlov and V.A. Zvorykin. Part of Chapter II of Part II was written by M.V. Sedykh. The authors thank V.I. Tikhonov, Engineer, who helped prepare the manuscript. There are 9 references: 8 Soviet and 1 English.

Patterns and volumetric equipment in aircraft construction (Shablony i ob'yemnaya osnastka v samoletostroyenii) Moscow, Oborongiz, 63.
0399 p. illus., bibliog. 3,200 copies printed

TOPIC TAGS: aircraft lofting, airframe, airplane building, pattern, template, mold, template manufacture, three dimensional pattern equipment, surface pattern, section pattern, molding practice

PURPOSE AND COVERAGE: The book describes methods of preparing templates, three-dimensional patterns, stamping equipment, assembly units, and their use for the manufacture and control of airplane parts. Equipment and tools are described used in air frame and lofting practice. The book is intended for designers and technicians in airplane building enterprises, and at the same time can be useful to students in aviation higher institutions and technical schools.

TITLE: A device for studying flow in a shock tube. Class 42, No. 182372

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 11, 1966, 87

TOPIC TAGS: shock tube, flow analysis, aerodynamic R and D

ABSTRACT: This Author's Certificate introduces a device for studying flow in a shock tube. The unit contains a probe with pressure gauges, a specially shaped stand with guides for moving the tube, and a worm-gear speed reducer in this stand with an electric drive. The device is designed for determining flow uniformity in a supersonic shock tube. The probe is made in the form of two telescoping tubes with the outer tube mounted in the guides of the stand. A toothed rack fastened to this tube is used for connection to the electrically driven worm-gear speed reducer. The pressure gauges are connected to the readout instruments by telescoping tubes (e. g. copper tubing) with a sliding fit and sealing devices.

Tissue/Medicine - Tissue Therapy
"Tissue Therapy of Inflammatory Gynecological Infections,"
T.K. Orlov (Minsk)

Akusher i Ginekol., No 5, pp 61-63

Filatov's technique of transplantation of tissue (cattle spleen or placenta) proved effective in the treatment of inflammations due to gynecological diseases. The effectiveness of treatment with tissue transplants depends upon proper selection of patients and consideration of indications and contraindications. If treatment is begun early,

268738

before conditions become chronic, recovery usually is quicker and fewer transplants are required. Outcome of the healing process depends much upon the method of conserving the tissue and the technique used. Tissue therapy alone was effective in 59.8% of cases; tissue therapy in combination with other types of treatment produced recovery in 80.2% of cases under treatment.

TITLE: Durable paints for ships

SOURCE: Morskoy flot, no. 2, 1966, 39

TOPIC TAGS: shipbuilding engineering, paint / XB-53 paint, NIVK paint

ABSTRACT: The use of the new XB-53 paint for painting ship hulls is discussed on the basis of experience acquired by Riga Ship Repair Yard since August 1964. The greatest advantage of this paint is its property of quick drying in winter. Two layers of paints need only 2.5 days for drying at a freezing temperature of -5 C, while the old paints of NIVK type need 5 days. In summer, only 1.5 days are required. The XB-53 can be used for painting at temperatures down to -20 C. It stands up well to the action of air and is less expensive than the paints of NIVK series. However, the XB-53 becomes very toxic in summer and the use of gas masks is prescribed. No gas masks are usually needed in winter.

~~-20(6) 20.4000~~AUTHOR: Orlov, V., EngineerTITLE: Helmsmen of Cosmic Space. Inertial NavigationPERIODICAL: Tekhnika molodezhi, 1960, Nr 1, pp 33-34 (USSR)

ABSTRACT: In this article the author explains what navigation means and describes the new method known as inertial navigation. Compared to astronomic and radio-navigation, this method offers many advantages. The position and the velocity of the flying body is in this case determined by means of instruments which need no external signs of orientation and which are located in the flying body itself. In this system, accelerometers and integrators are used. The most important of these devices is the accelerometer, in which the principle of inertia is used. Three accelerometers and 6 integrators will be required on a space ship, because in the case of an arbitrary motion, acceleration must be measured in three coordinate directions. As such, 3 arbitrary directions, which are perpendicular to one another and are constant with respect to the stars, may be assumed. They are adjusted on board the space ship by means of a stabilizing gyroscopic device. The flight of a rocket or of a space ship

SOURCE: Morskoy flot, no. 6, 1966, 36-37

TOPIC TAGS: corrosion, intergranular corrosion, steam boiler, aqueous solution, high temperature effect, hydrogen embrittlement, steel, HYDROCHLORIC ACID

ABSTRACT: Metal samples were treated with 5% hydrochloric acid solutions at 20 and 60°C to determine the effect of the solution on hydrogen embrittlement and loss of metal due to corrosion, as well as to supplement the inadequate data on this subject. The experimental results showed that 1) normalized metal exposed for 4 hrs to acid solutions at 20°C shows no decrease in plasticity when the temperature of the acid solution is raised to 60°C, 2) the decrease in plasticity of a metal treated with a solution of high temperature for 2 hrs is substantially greater than when treated with

Polymerization of di- β , β' -chloro-ethyl ester of vinyl phosphinic acid

PERIODICAL: Plasticheskiye massy, no. 4, 1962, 6-8

TEXT: The kinetics of the block polymerization of $\text{CH}_2=\text{CHP}(\text{O})(\text{OC}_2\text{H}_4\text{Cl})_2$ (I) was studied. The fraction used was produced at 140-143°C 2-3 mm Hg, $d_4^{19} = 1.3196$, $n_D^{19} = 1.4780$; the initiators benzoyl peroxide (II), azoisobutyric acid dinitrile (III), isopropyl benzene hydroperoxide (IV), lauryl peroxide (V), tertiary butyl peroxide (VI) were fresh. $P = K\Delta V$, where P = polymerization depth, %; ΔV = reduction in volume of the polymerizing system as percentage of initial value; K = coefficient. $K \approx 8$ according to the polymer yield. Maximum polymer yield was 70-85 % with the catalysts mentioned. The polymerization rate is at first constant, decreasing from a certain depth of conversion. Air accelerates it. X

Polymerization of di- β , β' -chloro-ethyl...

Depending on the test conditions, a viscous, resinous substance, or an insoluble, elastic, yellow product, is formed. Repeated precipitation from a solution of the resinous substance in acetone by means of diethyl ether, will separate the polymer as a solid, brittle, white, strongly hygroscopic substance which is soluble in polar organics. The ebullioscopically measured molecular weight was 2700, that of the polymer isolated at 5-8 % conversion depth, 1200. 21-hr fractionation of the resin at 110°C in the presence of 4.44 % by weight of VI yielded four fractions with specific weights of 13.2-40.6, specific viscosities of 0.096-0.335 (5 % acetone solutions), and molecular weights of 1900-6000. The softening temperature, determined thermomechanically, was ~50°C. The softening temperature, determined thermomechanically, was ~50°C. The log v_{in} = $-6640/T + 17.436$ holds for polymerization of I with III. The activation energy of polymerization of I was 30.4 kcal/mole. For polymerization of I with III: $v_{in} = 0.105/\bar{C} - 0.00198$, where C = initiator concentration in molar parts. The presence of 0.1-0.7 % water reduces the rate of polymerization several times. It is suggested that the low molecular weights of polymeric esters of vinyl phosphinic acid are
