

L 36116-06

ACC NR: AT6017027

film anisotropies. A study is made of the feasibility of optimizing the magnetic properties by the selection of films according to thickness and composition. It is found that, by selecting a thickness at which  $H_C$  is at a maximum, it is possible to raise the current threshold of information decay. An increase in  $H_k$  with a constant magnetostriction of the films leads to a reduction of its angular dispersion, in view of which the alternating magnetization of the films in mutually perpendicular fields corresponds closer to a simple model of magnetization rotation. An increase in  $H_k$  leads to a proportional increase in the address currents, but this may be somewhat compensated by decreasing the dimensions of the elements. The relations obtained pertain to films the manufacture technology for which is still being developed. Orig. art. has: 4 figures and 1 table.

TITLE: Test stand for thin-film magnetic memory matrices <sup>160</sup>

SOURCE: AN UkrSSR, Kiberneticheskaya tekhnika (Cybernetic techniques). Kiev, Naukova dumka, 1965, 19-26 <sup>14</sup>

TOPIC TAGS: memory core, thin film memory, magnetic thin film, test instrumentation, matrix element

ABSTRACT: The article deals with the problem of the processing of thin-film matrices for the operational memory devices of computers and other related equipment. A method is proposed whereby these matrices are checked for four threshold characteristics (writing current "1", erasing current "1", writing current "0", and erasing current "0"). These criteria are then employed to determine permissible current tolerances for the matrix and memory unit as a whole. The characteristics are tested on a pulse stand under conditions simulating real conditions. Various test techniques are considered. The pulse routine is shaped by means of a generator, with the results of the test automatically recorded. The stand itself, which is described in some detail, consists essentially of the generator which provides the program required for the testing of the threshold character-

Card 1/2

istics, a measuring unit, a broad-band amplifier, scope, automatic recorder, and a triggering generator. The pulse amplitude is formed through the use of power transistors which are gated. Leading edge time is no more than 50 nsec. This test stand has been used for work with magnetic matrices and memory cell quality control. Orig. art. has: 5 figures.

AUTHORS: Gayduk, V.I., Nesterova, Ye.P. and Ostapenkov, A.M.

TITLE: Contribution to the simplified nonlinear theory of travelling-wave tubes

PERIODICAL: Izvestiya vysshikh uchebnykh zavsheniy, Radiotekhnika, v. 4, no. 3, 1961, pp. 254 - 261

TEXT: The nonlinear theory of travelling-wave tubes (TWT) is well developed (Ref. 1 - A. Nordsiek, PIRE, 1953, 41, No. 5, 1196; Ref. 2 - Vaynshteyn, L.A., Nonlinear theory LBV, Parts I, II, III; Radiotekhnika i elektronika. 1957, Vol.2, No.7, 887 and 1947, v.2, No.8, 1027; 1958, 3, No. 1, 80; Ref. 3 - P.K. Tien, L.R. Walker, V.M. Wolontis - PIRE, 1955, 43, no. 3, 260; Ref. 4 - J.E. Rowe - IRE Trans. 1956, ED-3, no. 1, 39) but leads to complex integral-differential equations which cannot easily be solved. It appears, however, that comparatively simple methods of analysis of the nonlinear effects are possible. In particular, if it is required to evaluate the energy transferred to the field by a charge, it is not necessary to solve the equations of motion and the energy  $E(t)$  or  $E(x,y,z)$  can

Card 1/6

29621  
S/142/61/004/003/002/016  
E192/E382

Contribution to ....

be determined directly from the system of differential equations. The average power transferred by the electron beam to the high-frequency field can then be found by determining the mean of the solution over the whole ensemble of particles. This approach is illustrated in the article. It is assumed that an electron moving along the axis  $x$  interacts with the electric field  $E_1 \cdot e^{Yx} \cdot \cos(\omega t - \beta x)$  of the wave propagating along a slow-down structure, also along the axis  $x$ . The equation of motion of the electron is in the form:

$$m_x \ddot{x} = - eE_1 \cdot e^{Yx} \cdot \cos(\omega t - \beta x) \quad (3)$$

where:

$$e = |e| > 0; \quad \beta = \omega/v_\phi$$

where  $v_\phi$  represents the phase velocity. Now, the electron efficiency can be expressed by:

Card 2/6

29621

S/142/61/004/005/002/016

E192/E382

Contribution to ....

$$\eta = \frac{\frac{mu_0^2}{2} - \frac{mu^2}{2}}{\frac{mu_0^2}{2}} = 1 - \left(\frac{u}{u_0}\right)^2; \quad u = u_0 \cdot |1 - \eta| \quad (4)$$

where  $u_0$  is the velocity of the particle at the beginning of the interaction, and

$u$  is the instantaneous velocity of the electron.

If it is assumed that  $\eta$  is the unknown and the second unknown is the phase  $\phi = \omega t - \beta x$ , the differential equations are in the form:

$$\frac{d\eta}{dx} = \frac{2eE_0}{mu_0^2} e^{i\phi} \cos\phi; \quad \frac{d\phi}{dx} = \frac{\omega}{u_0} (1 - \eta)^{-1/2} - \beta \quad (5)$$

The solution of  $\eta(x)$  is dependent on the initial phase  $\phi_0$ .

Eqs. (5) can further be written as:

Card 5/6

29621

S/142/61/004/003/002/016

E192/E382

Contribution to ....

$$\frac{d\eta}{dy} = h \cdot \cos\Phi \cdot e^{\mu_1 y}; \quad \frac{d\Phi}{dy} = \frac{1}{C} \left( \frac{1}{\sqrt{1-\eta}} - \frac{1}{1+C\mu_2} \right), \quad (7)$$

where:

$$y = \frac{\omega \cdot C x}{u_0}$$

and  $h = 2cE_1/mu_0 \cdot \omega C$  and  $\mu_1, \mu_2$  are the Pierce parameters;  
 $C$  is the coupling coefficient between the beam and the line  
and  $h$  is the normalised initial amplitude of the wave. If  
the electronic efficiency of the system  $\eta$  is low, Eq. (7)  
can be simplified and written as:

W

$$\frac{d\eta}{dy} = H \cos\Phi \cdot e^{\mu_1 y}; \quad \frac{d\Phi}{dy} = \mu_1; \quad H = \frac{h}{2C} = \frac{cE_1}{mv_0 \cdot \omega C^2} \quad (8)$$

Card 4/6

29621  
S/142/61/004/003/002/016  
E192/E382

Contribution to ....

where  $\xi = n/2C$ . The systems of differential equations (7) and (8) are much simpler than the exact equations (Ref. 1). These equations were integrated numerically and the results are shown in some figures. In particular, the mechanism of the bunching of the electrons is illustrated in Fig. 3, where the electronic efficiency of the system is plotted as a function of the coordinate  $y$ . The figures illustrate two cases: in the first case, the electron velocity is small, which corresponds to  $b = -1$ , while, in the second case, the electron velocity is comparatively high ( $b = 1.5$ ). The numbers shown on the curves in the figures illustrate the number of the electrons. The above method permits determination of the electron energy transferred to the high-frequency field and is in satisfactory qualitative and quantitative agreement with the exact theory. It can also be used to analyse more complex systems. There are 5 figures and 11 references: 6 Soviet-bloc and 5 non-Soviet-bloc. The four English-language references mentioned are: Refs. 1,3,4. (quoted in text) and Ref. 7 - C.C. Cutler - BSTJ, 1956, 35, No. 4, 841.

TITLE: Observations of the content of chlorophyll "a" in the seston of the surface layer of marine waters

SOURCE: Okeanologiya, v. 6, no. 5, 1966, 849-852

TOPIC TAGS: chlorophyll, oceanography, botany

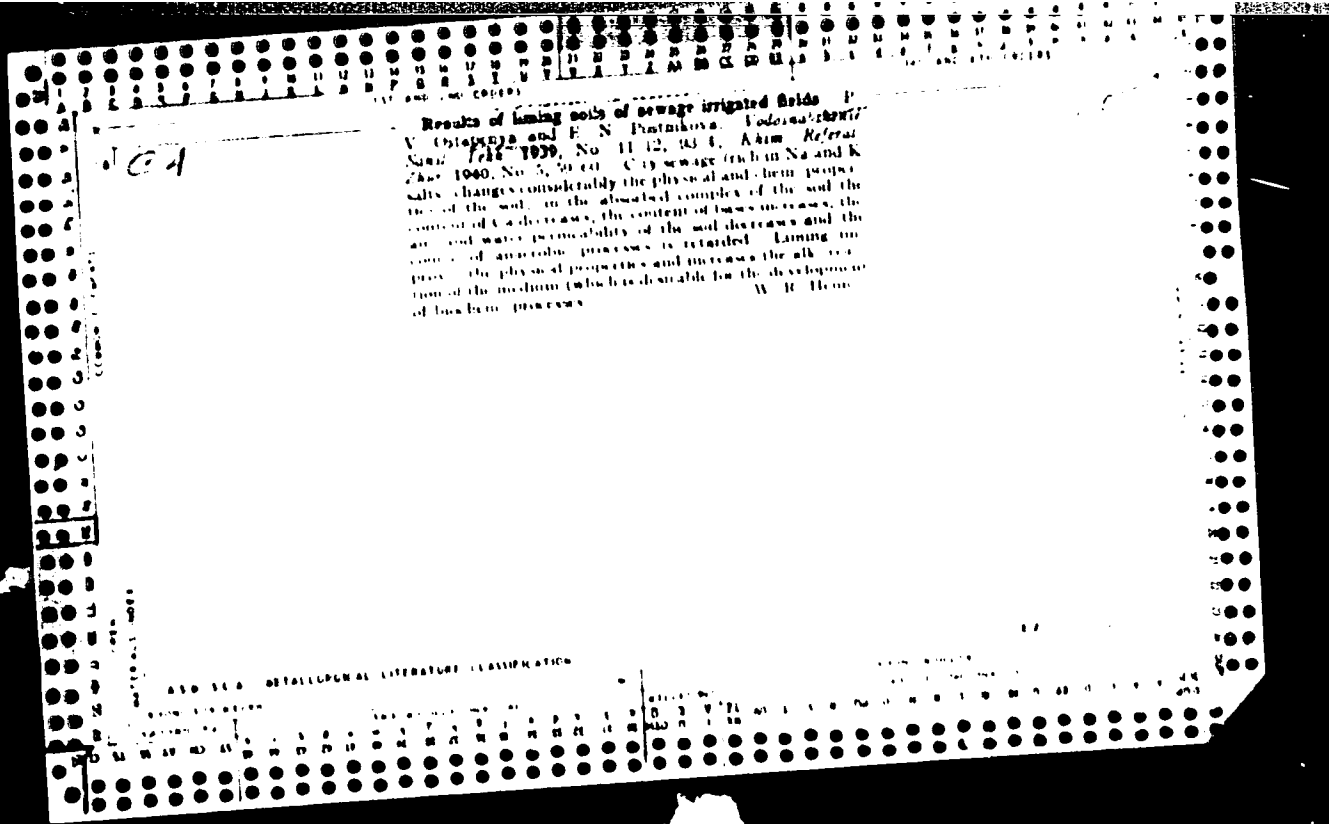

SUB CODE: 06,08

ABSTRACT: The authors present the results of determination of the content of chlorophyll "a" in the surface layer of waters of the coastal regions of the Barents Sea, Norwegian Sea, Mediterranean Sea, the open part of the North Sea and Atlantic Ocean near Madeira Island and in the English Channel. The data were collected during the 16th and 17th voyages of the "Bataysk" in the late summer and autumn of 1963. A map of this area shows the content measured at specific points. The chlorophyll "a" was extracted by 100% acetone after the samples first had been soaked in distilled water. The computations were made using the equations suggested by UNESCO. A table in the article gives the chlorophyll "a" values and chlorophyll "a"/carbon ratio in seston. The boundary between the low-productive southern waters and the more productive northern waters lies near 46°N. Orig. art. has: 1 figure and 1 table. [JPRS: 39,180]

Hygienic evaluation of subterranean waters in connection with the effect of underground peat beds. P. V. Ostapenya and Ts. A. Kagan. *Gigiena i Sanit.* 13, No. 11, 19-15 (1948). — The chemistry of ground water coming in contact with subterranean peat deposits or analogous org. masses is altered and the high level of  $\text{NH}_4$  and high oxidizability of such waters do not necessarily indicate sanitary contamination. Analyses of numerous samples taken from many U.S.S.R. locations are cited. Passage of a typical sample contg. 0.11 mg/l.  $\text{NH}_4$  over activated C gave complete absorption of the  $\text{NH}_4$ . Addn. of 0.1-0.5 mg. l.  $\text{NH}_4\text{Cl}$  gave complete absorption of the original  $\text{NH}_4$ , but the added  $\text{NH}_4$  was unaffected, indicating uptake of only the colloidal  $\text{NH}_4$  salts of humic matter. The Fe content of such waters is similarly caused by the soln. of Fe salts in the form of humic derivs. as pointed out earlier (cf. K. and Borishanskaya. *C. I.* 37, 5175).

Title : Some Data on the Content of Iodine, Fluorine and Copper in Natural Waters of Poles'ye Lowlands

Orig Pub : Zdravookhr. Belorussii, 1956, No 7, 40-43

Abstract : In waters of Quaternary levels within the territory of Poles'ye there is less I than in waters of the same levels beyond its borders; in more ancient levels content of I and Br increases. In mineralized waters of the brine type the amount of I reaches 8.0 mg/liter. In the area of Gomel waters of the chalk stratum have an I content of 24.15  $\mu$ g/liter, and 250/4  $\mu$ g/liter of Br. According to analysis data of 19 samples of water taken in August 1955 from the river Pripyat and its tributaries in mg/liter: F up to 0.13, Cu 1.0 - 8.0. Relatively low concentration of F makes possible mass occurrence of dental caries in man and animals.

TITLE: The use of organomagnesium compounds to synthesize steric-hindered phenols

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 1, 1966, 174-176

TOPIC TAGS: phenol, chemical synthesis, Grignard reagent, organomagnesium compound, *BROMIDE*

ABSTRACT: The authors studied the interaction of five different 4-hydroxy-3,5-dialkylbenzyl bromides with ethyl magnesium bromide. With an excess of Grignard's reagent the hydroxy benzyl bromides form corresponding para-n-propylphenols with yields of 60-80% regardless of the dimensions of the alkyl substitutes. This reaction makes it possible to synthesize the most diverse para-alkylphenols by proceeding from the appropriate 2, 6-dialkyl-p-cresols. The authors point out that the formation of alkylphenols from hydroxyalkylbenzyl bromides proceeds well only with the use of an excess of the organomagnesium compound. The authors thank N. M. Emanuel for constant interest in this work during its fulfillment. Orig. art. has: 1 table.

NOTE: At 100°C temperatures, sulphur reacts with water according to the reaction:  $S + 3H_2O \rightleftharpoons 2H_2 + H_2SO_3$ . No  $SeO_3^{2-}$  and  $Se^{2-}$  ions could be detected iodometrically when an aqueous suspension of Se ( $H_2O_2 = 1:200$ ) was kept at 90°C for 12 hours, pH being varied between 5 and 7. No precipitates of selenides were observed when salts of Sn, Sb, Pb and Cu(II) were added. On the contrary, insoluble selenides and  $SeO_3^{2-}$  ions were obtained upon addition of salts of Ag, Cu(II) and Hg(II). Thus the equilibrium of the reaction  $Se + 3H_2O \rightleftharpoons 2H_2 + H_2SeO_3$  is strongly shifted to the left; the reaction involved can be utilized to obtain selenides of metals, whose solubility is less than  $10^{-25}$  g-mole/l. It

TITLE: Use of nuclear methods for automation of the process of sorting ores from gold ore deposits

SOURCE: <sup>27</sup> Zavetnyye metally, no. 8, 1964, 20

TOPIC TAGS: mining engineering, gold, industrial automation, radiation instrument, spectroscopy, radiometry

Translation: The Central Scientific Research Institute of Tin has investigated radiometric methods of automating of the process of sorting gold-bearing ore obtained from Krasnoyarskiy Kray. In mineralogical composition, the ore mass is enriched with schists, phylites, and vein quartz. Gold is chiefly based on

A study of the  
and rock established that the separation of the ore  
Card 1/3

L 16313-65  
ACCESSION NR: AP5002052

if use is made of the value of the induced activity which arises as a result of irradiation of the material (ore or rock) by a neutron flux.

Since the gold content of the ore is minute, and the half-life of the radioactive isotope  $Au^{198}$  is 2.7 days, the direct separation of the ore and rock in a flow by means of the metal did not seem possible.

To solve this problem, other elements were used whose nuclear characteristics meet these requirements, namely, aluminum, which has a relatively high activation capacity.

In order to determine the possibility of separating ore and rock by the method of induced activity based on aluminum, a calculation was carried out for the sample under investigation (irradiation time used was 1 sec, and the flux  
which showed a difference in the induced ac-

of the Institute of Geology and Geophysics, Academy of Sciences of the USSR (Siberian Branch).

Treatment of the experimental data produced values of average specific activities for quartz, concretions, and dark and gray schists, which showed that

Card 2/3

L 16313-65

ACCESSION NR: AP5002052

for different mineralogical groups, the difference in specific induced activity is relatively great; thus, quartz and concretions used for further enrichment have an activity that is 2 to 4 times as high as that of the schists.

The possibility of separating ore from the rock by using spectra of in-

duced activity in the region of soft gamma radiation with an energy up to 1 Mev was also checked.

Analysis of the data obtained showed that the resolving power of the spectrometric method was greater than that of the measurement of the integral induced activity. Thus, the recording of soft radiation in the region of 1 to 20 channels gives a 6- to 3-fold difference in the induced activity of quartz and concretions with schists, against a 3-to 2-fold difference in the case of the recording the integral induced activity.

The calculated and experimental investigations which were carried out showed the fundamental feasibility of separating ore from the rock of the gold-ore deposit by use of the induced-activity method.

Abstract : The experimental results are discussed of stubble sowing under conditions of irrigation in the south of the Ukraine, conducted in 1955 at a kolkhoz in Khersonskaya Oblast' and at the Genicheskaya Experimental Melioration Station from 1953 to 1955. At the experimental station the green stuff yield of the stubble culture, sown after the winter wheat was harvested, was (in centners per hectare): corn 375, a sorghum-Sudan grass hybrid 301, Sudan grass 274, sorghum 266, fodder grass (pennisetum typhoideum) 240.

TITLE: Effect of high altitude conditions of the Pamir type on higher plants

SOURCE: Vsesoyuznoye botanicheskoye obshchestvo. Problemy botaniki, v. 7, 1965. Voprosy biologii i fiziologii rasteniy v usloviyakh vysokogoriy (Problems of biology and physiology of plants at high altitudes), 5-21

TOPIC TAGS: UV light, UV irradiation, plant development, plant ecology, radiation plant effect, plant growth, solar radiation effect

ABSTRACT: From 1940 to 1960 the Pamir Botanical Garden in Khorog investigated the effects of high altitude conditions on over 10,000 plants growing on Pamir slopes, which are marked by a dry continental climate and intense solar radiation. In the present article inherent characteristics of high altitude plants and effects of intense UV radiation including literature data are discussed. In a series of

Card 1/2

L 27494-66

ACC NR: AT6013446

0

experiments using a quartz UV lamp to simulate solar radiation, the effects of different light intensities on plants were studied. Findings indicate that large UV radiation doses which often cause plant injuries under normal altitude conditions do not kill a single plant and in some cases produce a definite favorable effect. Productivity of many plants, such as onion, carrot, and barley, is increased with reduction of distance between plants and the UV lamp. Beet, radish, and sorghum crops are decreased with direct UV radiation and markedly increased when plants are placed along both sides of a lamp, indicating that these crops react more favorably to smaller UV radiation doses. Potatoes, cabbages, and beans react negatively to UV radiation. With irradiation of carrots, the roots increase in size and branch out extensively and the number of leaves also increases, indicating that UV radiation activates meristeme differentiation and induces new plant formations. In some cases the aftereffect of UV radiation is expressed in the following generation by changing an annual into a perennial. The dry climate and intense solar radiation of the Pamirs provide a unique natural laboratory for investigations of this type. Orig. art. has: 8 figures.

TITLE: The Motion of a Thin Blunt <sup>26</sup>Cone at a Small Angle of Incidence at Large Supersonic Velocity

PERIODICAL: Izvestiya Akademii nauk SSSR. Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1960 Nr 3 pp 121-125 (USSR)

ABSTRACT: The effect of bluntness on the pressure distribution along the generators is considered. A qualitative picture of the flow is constructed. The results of experimental investigations are given and an approximate law of similarity is constructed. A cylindrical coordinate system is introduced, the x-axis lying along the axis of the cone. The equations expressing the conservation of mass, impulse and energy in a volume bounded by the surfaces of the shock wave, the body and two neighbouring meridional planes are written in integral form. Two types of bluntness are considered one being in the form of part of a sphere and the other being in the form of a plane face. In the first case

Card 1/3

S/179/60/000/03/018/039  
E031/E413

The Motion of a Thin Blunt Cone at a Small Angle of Incidence at Large Supersonic Velocity

it is assumed that the pressure is distributed over the sphere according to Newtonian theory. Neglecting terms of the order of the square of the angle of incidence suitable forms for the unknown quantities are substituted in the equations. The sum of terms of the order of the angle of incidence are equated to zero and integrals involving a term in the density are excluded. Then two equations are obtained for the pressure  $p_1(x)$  and  $R_1(x)$  (the pressure is sought in the form  $p_0(x) + a \cos \varphi p_1(x)$   $a$  being the angle of incidence and  $\varphi$  the azimuthal angle).  $R$  the distance from the axis of the body to the shock wave is sought in the same form. In order to solve the equations it is necessary to know the values of  $p_0(0)$  and  $R_1(0)$  which requires an additional condition for  $x$  approximately zero. On the other hand, for  $x$  greater than or equal to approximately 2 the solution virtually does not depend on  $p_1(0)$  or  $R_1(0)$  The pressure distributions are
