then the three-color coordinates in the zonal system, being simultaneously the mean values of the coefficient of reflection (transmission) of the object, determine its spectrophotometric curve with good approximation. This circumstance permits, knowing the coordinates of the light in the zonal system for mixed dyes, to determine approximately the zonal coordinates of the light of their mixture by simple multiplication. Results of calculations of the color of mixtures of three dyes, used in multi-emulsion photography materials are given: (a) exact calculation from the transmission curves, and (b) calculation with the aid of the zonal coordinates of the light. The agreement between the results is sufficiently good in many cases to permit replacing the complicated calculation using the spectral curve by the considerably simpler zonal calculation. Examples are given for the use of the zonal system for the comparison of various color triads of positive materials and for the calculation of correcting light filters when setting up the light in the process of printing film copies.

Investigating the adsorption ability of various hide powders H. S. Orzechits and I. Dukarskaya *Izvestiya Tsvetnoi Nauki i Tekhnologii* Inst. Kozhevnikov, Perm, 1932, No. 3, 58. Conversion factors for tannides

tested with German, British, Russian untanned and Russian chrome tanned hide powders were derived experimentally. These factors were based on the assumption that the tannide detid by the German hide powder in the tanning substance amounted to 100. Thus the relationship between the 4 powders was found to be German 1, British 0.05, Russian tanned 0.00 and Russian untanned 0.05 when the tanning substances in various parts of oak and oak ext. were detid. The procedure described and numerical data are tabulated. A. A. Bushfling

District Heating System Networks (Teplovyye seti), State
Power Engineering Publishing House, 1953
Periodical : Energetik, 11, 39-40, N 1955
Abstract : The author states that this book is the only basic
manual for the lower technical personnel employed in
district heating systems. He enumerates a series of
chapters and paragraphs which require more precise
definitions or revision and supplementation with more
data and certain tables. The book is considered useful.

TITLE:

The Experience in Repairing Central Heating Networks

PERIODICAL:

Energetik, 1959, Nr 8, p 16 (USSR)

ABSTRACT:

When reconstructing water mains in Moscow, corrosion was detected on a 20 m long section of the central heating mains. Apparently, this corrosion was caused by stray currents. The corrosion spots were distributed irregularly over the entire tube surface; they were sometimes up to 8 mm deep and covered an area of 10-15 cm². The tubes with 400 mm diameter were installed in 1945 without any protective channels. Since soil or internal corrosion was not observed, it was assumed that the thickness of the tube walls was 10 mm in those sections not attacked by corrosion. The repair had to be performed during the heating period without switching off the heat supply. Single corrosion holes were closed by electric welding (5-6 mm deep). In those areas, where an accumulation of corrosion spots was observed, tube sections of the same diameter were welded to the sound pipeline surfaces.

Card 1/2

SOV '91-59-8-10-15

The Experience in Repairing Central Heating Networks

More than 50 individual corrosion spots and 10 larger corrosion areas were repaired in this way. The heat supply was not interrupted. An editorial note says that the water circulation should have been switched off during the short period of fusion welding of the corroded areas without removing the water from the line. There are 2 diagrams.
