TITLE: Influence of Iron, Aluminum, Arsenic, Antimony, and Sodium upon the Process of Production of Electrolytic Manganese (Vliyaniye zheleza, alyuminiya, mysh'yaka, sur'myi natriya na protsess polucheniya elektroliticheskogo margantsa)

PERIODICAL: V sb.: Elektrokhimiya margantsa. Tbilisi, AN GruzSSR, 1957, pp 377-396

ABSTRACT: The effect of  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$ , Al, Na,  $\text{Sb}^{3+}$ ,  $\text{As}^{3+}$ , and  $\text{As}^{5+}$  in the electrolyte (E) upon the process of cathodic production of Mn from aqueous solutions containing Mn and  $\text{NH}_4$  sulfates is studied. It is established that: 1. When the E contains 0.01 g  $\text{Fe}^{2+}$  /liter, the Mn current efficiency drops 10-20% depending upon the pH of the E. An increase in  $\text{Fe}^{2+}$  concentration to 0.05 g/liter results in a sharp drop in current efficiency (as much as 0.6%). When the concentration of  $\text{Fe}^{2+}$  > 0.1%, alloys consisting chiefly of Fe and containing only a few percent Mn precipitate at the cathode. These alloys may

Card 1/2

SOV/137-58-8-16660

Influence of Iron, Aluminum, Arsenic, Antimony, and Sodium (cont.)

be obtained by electrolysis, with a current efficiency of > 40%. 2. Ions of Fe<sup>3+</sup> have a considerably smaller influence upon electrolysis than do ions of Fe<sup>2+</sup>. When the Fe<sup>3+</sup> contents of the E rise from 0.01 to 1.0 g/liter, the Mn current efficiency declines insignificantly (from 64 to 59%). 3. Addition of up to 1 g Al/liter has an insignificant effect in decreasing Mn current efficiency, but at 3 g Al/liter, the entire E is filled with a gelatinous precipitate of Al(OH)<sub>3</sub>, the current efficiency drops 10%, and a small amount of Al is found in the cathodic Mn. 4. As and Sb have a harmful effect upon Mn electrolysis. 0.001-0.05 g As or more per liter results in a sharp decline in current efficiency and impairs the quality of the cathodic Mn. The presence of large amounts of As causes cessation of deposition of metallic Mn, and a black tarnish appears on the cathode. Before the solutions arrive for electrolysis it is necessary to purify them of Sb and As by cementation of the Mn.. 5. Na does not have a harmful effect upon cathodic deposition of Mn.

TITLE: The Influence of Phosphorus on the Electrolytical Recovery of Manganese (Vliyaniye fosfora na protsess polucheniya elektrolycheskogo margantsa)

PERIODICAL: V sb.: Elektrokhimiya margantsa, Tbilisi, AN GruzSSR, 1957, pp 397-404

ABSTRACT: The influence of P on the process of cathode deposition of Mn from sulfate solutions was investigated. P was introduced into the electrolyte in the form of  $(\text{NH}_4)_2\text{HPO}_4$ ; it was established that as the P content varied from 0.01 to 5 g/liter the current efficiency diminished from 60 to 18%. Upon removal of the Mn phosphate deposit the electrolytic precipitation of Mn proceeds with a normal current efficiency. Tests were performed relative to the leaching of high-phosphorus ferromanganese by  $\text{H}_2\text{SO}_4$ , and the distribution of the P between the precipitate and the solution was established, also the degree of fugacity of the P relative to the acid concentration. The following was established from tests comprising the oxidation of Fe

Card 1/2

SOV/137-58-9-18767

The Influence of Phosphorus on the Electrolytical Recovery of Manganese

in the solutions obtained after leaching: a) At a pH of 1-2 the Fe oxidizes fully and upon further leaching up to a pH of 5 it precipitates in the form of  $\text{Fe(OH)}_3$  which is readily separated by filtration; b) the oxidizing activity of  $\text{MnO}_2$  diminishes significantly with increasing pH. At an electrolyte pH of 3-4 the solutions contain  $\text{Fe(OH)}_2$  which is not retained by the filter.

TITLE: Percolation Leaching of Usa Ore (Vskrytiye usinskoy rudy perkolirovaniyem)

PERIODICAL: V sb.: Elektrokhimiya margantsa. Tbilisi, AN GruzSSR,  
1957, pp 483-501

ABSTRACT: An investigation is made of percolation leaching of the ores of Usa. When the solution is delivered to the percolator at a rate of 100-150 cc/hr in a single piece of equipment 5 to 22g Mn may be extracted per liter of solution. An increase in temperature to 50-60°C makes it possible to operate at rates 4-5 times as high as at ordinary temperatures with the same extraction of Mn per unit volume of solution. The degree of Mn recovery attains 85-93%. Multi-stage percolation with 3 percolators in tandem showed up to 85% Mn recovery, while ~60% of the amount of H<sub>2</sub>SO<sub>4</sub> introduced was consumed in combining with Mn. Multi-stage percolation with 70 g H<sub>2</sub>SO<sub>4</sub>/liter at room temperature and 250 cc passage of solution per hour revealed extraction of up to 94% of the starting Mn and a concentration

TITLE: T6-P noctovisual theodolite

SOURCE: <sup>10</sup> Przeglad geodezyjny, no. 9, 1966, 370-375

TOPIC TAGS: theodolite, geodetic instrument, IR image converter, radiation sensitivity

ABSTRACT: Construction and advantages of the T6-P noctovisual theodolite are described. The geodetic instrument, constructed in 1961-62, is a modified version of the model T6. The adaptation of the older model to enable it to take measurements during the day, at night, and under unfavorable atmospheric conditions was achieved by means of a noctovisual telescope utilizing infrared radiation. This required the insertion of an optical-electronic image converter between the objective and focal lenses, transforming the infrared into visible rays. Such converters may be either vacuum tube or semiconductor-based. The latter type is preferable as its sensitivity range approaches the wavelength of several microns and it requires a comparatively low voltage of only several hundred volts. The infrared systems may be of an active character (based on detection of objects capable of natural infrared emission), or of a passive character (relying on an artificial infrared radiation source to illuminate

TITLE: Problems related to the usage of infrared radiation in geodesy

SOURCE: Przeglad geodezyjny, no. 7, 1966, 258-261

TOPIC TAGS: IR detection, theodolite, geodesy, radiation absorption, atmospheric radiation

ABSTRACT: Effect of the phenomenon of refraction in the lower atmosphere upon the course of an infrared ray is investigated. Absorption of the radiation by atmospheric gases is discussed as well as radiation scattering due to the presence in the atmosphere of solids and water vapor. It is established that the radiation absorption is insignificant. However, scattering of infrared radiation by clouds, rain, and fog is so great that infrared loses its advantage over visible light as far as its usefulness in geodesy is concerned. Briefly described is the application of infrared radiation in the noctovisual theodolite T6-P constructed by the author together with Engineer Roman Janczak, a WAT scientist. Reviewed is the history of discovery of infrared radiation and of the developments of its application in military, scientific, and industrial fields. Orig. art. has: 3 formulas, 3 tables, and 5 figures.

Title: Chromospheric Flareup and Magnetic Fields of Sunspots

Original

Periodical: Postepy astronomiczni, 1955, 3, No 1, 22-23; Polish

Abstract: In the author's opinion, the last cycle of solar activity, in spite of the large number of the Wolf numbers, it was weaker than the previous ones with respect to strong flareups with intensities of 2 and 3. The reduced number of flareups per spot or group of spots can be partly explained by the dependence of the number of flareups on the maximum intensity of the magnetic fields of the spots. In the equation  $n = a + bH^2$ , where  $n$  is the number of flareups per spot, and  $H$  the maximum intensity of the magnetic field of the spot, the coefficient  $H^2$  was 1 1/2 times smaller than in the preceding cycle. The reason for the reduced intensity may be a different

The presumed quatterylene of E. Clar, A. Zinke, L. Pack, R. Ott, and E. Weisenberger (Univ. Graz, Austria) *Monatsh.* 82, 384-7(1951).—Perylene (I) with 1 atom Br and AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> gives a compd. (II) named "quatterylene" by C. and Sandke (*C.A.* 43, 1350k) and assumed to arise through the condensation of 2 mols. I in the peri-positions. However, it is now found that both the 3,6-di-Cl and 3,10-di-Br derivs. of I with AlCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> likewise yield II, which makes Clar's formula unlikely. II forms brilliant, Cu-colored leaflets on vacuum sublimation, does not m. 483° (*loc. cit.*) in an evacuated capillary, but sublimes at about

490°. If pure, II dissolves in concd. H<sub>2</sub>SO<sub>4</sub> with blue, in PhMe or xylene with purplish red (weak greenish orange fluorescence), in PhNO<sub>2</sub> with yellowish red color. II is identical with the periflanthene prepnd. by v. Braun and Manz (*C.A.* 31, 7420) from fluoranthene or 4,4'-difluoranthyl. In the prepn. of II by Clar's method, 1 mol. I has therefore reacted with 2 mols. C<sub>6</sub>H<sub>6</sub>. In this reaction, was observed a by-product, more volatile on vacuum sublimation, brick-red platelets, m. 314°. U. Weiss

Title : A Study of the Factors That Determine the Primary Particle  
Size of Crystalline Insoluble Metal Salt Precipitates.

Orig Pub : Z. phys. Chem. (DDR), 1957, 207, No 3-4, 210-222

Abstract : It was found in the result of experimental studies of crystal dimensions in precipitates of insoluble salts that the main factor determining the particle dimensions was the solubility. The oversaturation of the solution plays an important part. The crystal dimensions decrease with the oversaturation rise corresponding to Weimar's rule. The diffusion process has a great influence. The quantitative connection of the crystal number with the stirring rate is shown.

Title : Micral — A New Synthetic Resin For Microscopy.

Orig Pub: Casop. mineral. a geol., 1957, 2, No 3, 305-311.

Abstract: A series of resins was obtained by the condensation of formaldehyde with urea and thiourea, named micral. They are resistant to aging and water, are transparent and colorless. It is possible to obtain resins with various refractive indices (1.49-1.54) by changing the molecular ratios of urea and thiourea. The micral can be successfully substituted for Canadian balsam, glycerin and glycerin-gelatin in microscopy.
