

ACCESSION NR: AT4040808

In the absence of a catalyst, significant polymerization was observed only at 15×10^6 r, yielding a waxy product. The presence of benzoyl peroxide accelerated the polymerization at radiation doses of $3-9 \times 10^6$ r, yielding solid products, which indicates that this reaction proceeds by a radical mechanism. Orig. art has: 1 table.

TOPIC TAGS: vinyl fluoride			
ABSTRACT: An Author Certificate has been issued for a preparative method for vinyl fluoride. The method involves the reaction of acetylene with hydrogen fluoride (1/1.5 molar ratio) in the presence of aluminum fluoride catalyst on heating. To increase the vinyl fluoride yield, the reactants are passed through a 13/1 aluminum fluoride/graphite mixture which had been pre-saturated with hydrogen fluoride, at about 380°C.	(SM)

TITLE: Radiation-induced polymerization of vinyl fluoride

SOURCE: Vyssokomolekulyarnye soyedineniya, v. 5, no. 8, 1963, 1277

TOPIC TAGS: fluorocarbon polymer, poly(vinyl fluoride), poly(vinyl chloride), Ftoroplast-4, Teflon polytetrafluoroethylene, radiation-induced polymerization, cobalt 60, gamma rays, initiator, benzoyl peroxide, radical polymerization

ABSTRACT: The higher heat, chemical, and light resistance of poly(vinyl fluoride) (PVF) as compared to poly(vinyl chloride) and the possibility of substituting PVF in certain cases for Ftoroplast-4 [polytetrafluoroethylene, or Teflon] have prompted a study of the synthesis of PVF by radiation-induced polymerization. The monomer was prepared from pure HF and C₂H₂, separated from excess HF and C₂H₂ and irradiated in sealed ampoules with γ -rays from a Co⁶⁰ source at a dose rate of 34 r/sec. Irradiation in the absence of initiators yielded waxy products. In the presence of benzoyl peroxide a yellowish solid product was obtained.

Cord 1/2

L 14414-63
ACCESSION NR: AP3004713

The PVF yield increased in both cases with an increase in the radiation dose.
Acceleration of the polymerization in the presence of the initiator indicates
that the polymerization follows the radical mechanism.

Title : Concerning the quantitative determination of magnesium in food products
Periodical : Vop. pit., 47-47, May, Jun 1956
Abstract : The colorimetric method for the determination of magnesium in food products as presented in the book "Methods for Studying the Composition of Domestic Food Products" is not sufficiently accurate. The method is based on the precipitation of magnesium as ammonium molybdate with ammonium phosphate. When ammonium molybdate reacts with the precipitate, a blue colored complex is formed after reduction which is compared with a standard in a colorimeter. In the directions, it is recommended that the precipitate be washed twice with ammonia followed by a single washing with an alcoholic solution of ammonia to remove the excess ammonium phosphate. The author points out that this is insufficient washing and some phosphate ion is still left in the precipitate which on reduction with hydrosulfide, interferes.

Card 2/2

FD-3071

intensity of the color. Check runs were made (using pure magnesium sulfate) by washing the precipitate to a negative phosphate ion test and the results compared with that of the given method. The outcome was that on multiple washing, the result was within 3.5% of the true value, while on using the recommended procedure, the result was 27% higher than the true value. No references.

The appraisal of Hungarian drinking waters. Iános
Páter (Magyar Államvasutak Végvárosi Lab., Budapest,
Hódmező-Körhely 30, 304-721000). Three categories of
waters are described, the limit values of which are as follows:
total solids 881 (good drinking water), 1211 (ordinary drink-
ing water), 3144 (bad drinking water); Cl, 37, 60, 257;
NO₂, 29, 55, 218; NO_x, 0.12, 0.30, 1.50; NH₃, 0.03, 0.20,
1.70; SO₂, 97, 181, 872 mg./l.; alkalinity 0.7, 8.7, 14.7;
total hardness 18.6, 30.6, 44.4° German; and O consump-
tion 1.92, 3.60, 5.80 mg. O₂/liter. Finally

c a. 14

14

Diagrams illustrating the chemical composition of drinking waters. János Pátri (MÁV Körp. Kacsóhgyáni Hivatala, Budapest, Hung.). *Hidrol. Kölcsönz. 30*, 428-30 (1950). - For the quick preparation of diagrams showing the most important data for drinking waters a system of 3 coordinates is used. One coordinate serves for plotting the values of alk., total hardness, and total solids, another for sulfate, chloride, and nitrate contents, and a third for O consumption and of nitrite and NH₃ content. The basic coordinates show the standard values of good drinking waters. If the respective values for a water sample are above or below the standard data, the value is plotted above or below the coordinate. Thus the triangular diagram shows instantaneously whether the water is above or below the standards of a good drinking water.

(1) Significance of taste-spilling constituents in the
hygienic evaluation of drinking water (In Russian) —
J. Páter. (Acta Technica Academias Scientiarum Hungaricarum) — Vol. 9, 1934, No. 1-2, pp. 49—64, 4 figs.,
3 tabs.)

In the hygienic evaluation of drinking water it is
advisable to bear in mind not only the water, but, from
the physiological point of view, the human organism
as well. It would therefore be desirable that physiologists,
besides examining the metabolism of salts, also pay
attention to the hitherto neglected field of metabolism
of water. In the hygienic evaluation of water issuing

in sunk wells, especially in the Great Hungarian Plain
the standards are too strict, therefore, greater allowances
can be made to comply with the physiological
requirements of the human organism.

Behavior of the low-temperature tar produced at Most during high-pressure hydrogenation. Evzen Patera, Freiberg, Festschr. A36, 21-76, discussion 29-32 (1955). The heat-transfer decrease of exchangers used in the pressure hydrogenation of low-temp. brown-coal tars (I) produced at Most (Drix, Czechoslovakia) was found to be caused by the polymerization of polyhydric phenols present in I and by the formation of a deposit on heat-transfer surfaces. Detailed information on the behavior of different fractions of I in the hydrogenation preheaters, heat exchangers, and superheaters is given. The elec. precipitator tar (II) of Lurgi low-temp. carbonization, as used at Most, contained phenol 0.3, cresols 0.8, and xylenols 1.7%. The middle oil of II contained phenol 2.5, cresols 5.2, xylenols 5, and polyhydric phenols (III) 8-42.5%. III congl. pyrocatechol 37, isohomopyrocatechol 18, homopyrocatechol 32, dimethylpyrocatechol 9, and other polyhydric phenols 9%. Owing to its low H/C ratio, I must be preheated as quickly as possible and should be processed in mixt. with other high H/C ratio tars.

TITLE: Momentum spectrum of baryons in inelastic collisions between
fast pions and nucleons

SOURCE: Zhur. eksper. i teoret. fiz., v. 45, no. 2, 1963, 381-383

TOPIC TAGS: baryon, momentum spectrum, pion-nucleon collision, pion-
pion collision, SIGMA hyperon, LAMBDA hyperon

ABSTRACT: It is shown that the reason for the double peak observed
in the Λ and Σ hyperon momentum spectrum in inelastic collisions be-
tween fast pions and nucleons at energies close to 10 BeV is a direct
consequence of the resonant interaction between the primary negative
pion and the intermediate particle that transmits the bulk of the
interaction in peripheral pion-nucleon collisions. Similar double

TITLE:

Investigation of Λ -hyperon and K^0 -meson production
processes in πp interactions at 7-8 Bev

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44,
no. 2, 1963, 431-443

TEXT: The c.m.s. momentum and angular distributions determined for the
 Λ and K^0 particles produced in πp interactions are given and discussed.
The measurements were made using a 24-liter propane bubble chamber in a
field of 13,700 es. The total momentum spectrum of the Λ -hyperons
produced in the reactions

Card 1/7

Investigation of Λ -hyperon ...

are shown in Fig. 1, compared with theoretical results. As it may be seen the statistical theory describes the experimental curve very well if the isobars and the cases with $p_p - p = \Delta < 700$ Mev are neglected.

$\Delta < 700$ Mev corresponds to $\sim 30\%$ of all Λ , these being produced in peripheral interactions. The Λ angular distribution has a distinct backward peak ($\bar{n}_\Lambda / \bar{n}_\Lambda = 0.18 \pm 0.02$). With increasing multiplicity n_s the agreement between experiment and statistical theory improves. The Λ angular distribution and the distribution with respect to p_\perp is virtually independent of n_s . The overall mean of the transverse momentum is 383 ± 12 Mev/c; for $\Delta < 700$ Mev, $\bar{p}_{\Lambda_1} = 295 \pm 14$ Mev/c and for $\Delta > 700$ Mev, $\bar{p}_{\Lambda_1} = 432 \pm 18$ Mev/c. For the $K^0(K^0)$ mesons produced in the reactions

Card 2/7

Investigation of Δ -hyperon ...

$$\pi^- + p \rightarrow \begin{cases} K^0 + \Lambda(\Sigma^0) + nn, & (1) \\ K^0 + \bar{K}^0 + N + nn, & (2) \\ K^0 + K^- + N + nn, & (3) \\ \bar{K}^0 + K^+ + N + nn, & (4) \\ K^0 + \Sigma^\pm + nn. & (5) \end{cases}$$

the total momentum spectrum measured (Fig. 4) is weaker than that calculated according to the statistical theory. The angular distribution (Fig. 5) has, besides the isotropic part, a forward peak ($n_0/n \approx 1.61 \pm 0.15$). The forward-backward ratio decreases with increasing n_0 . For the charged pions arising in Δ -production events the momentum distributions are, for $p_n > 400$ Mev/c, well described by the statistical theory without taking the isobars into account; for $p_n < 400$ Mev/c it is higher than that obtained from theory. The angular distributions for $n_0 = 2, 4, 6$ are characterized by

Card 3/7

Investigation of Λ -hyperon ...

S/056/63/044/002/007/065
B102/B186

8

$$\bar{n}_{\pi^+}/\bar{n}_{\pi^+} = 1.10 \pm 0.12, \quad \bar{n}_{\pi^-}/\bar{n}_{\pi^-} = 1.40 \pm 0.13.$$

The mean number of π^0 mesons produced per $\pi^- p$ interaction with Λ production is 1.23 ± 0.14 . The angular distribution of π^+ arising in stars with K^0 production has a flat forward maximum ($\bar{n}_{\pi^+}/\bar{n}_{\pi^-} = 1.10 \pm 0.10$). The mean number of charged particles produced together with Λ is $n_c = 2.22 \pm 0.13$ which agrees closely with the statistical theory without the isobars. The main part of Λ and K^0 is produced in two-pronged stars. The admixture of $K^0 \Sigma^\pm$ pairs amounts to less than 20% of the number of $K^0 K^- + K^0 K^+$ pairs. The momentum distribution of charged pions from $\pi^- p$ interactions with Λ -hyperon production are characterized by $\bar{p}_{\pi^+} = 425 \pm 16$ Mev/c and $\bar{p}_{\pi^-} = 444 \pm 15$ Mev/c. From a comparison of these angular distributions it is concluded that processes involving ΔK or $K\bar{K}$ pair production are more central than the usual processes of multiple pion production. If one divides the $\pi^- p$ interactions with strange particle production into head-on

Card 4/7

Investigation of Λ -hyperon ...

8/056/63/044/002/007/063

8

and peripheral collisions one can say that those involving $K\bar{K}$ pair production are rather of the head-on type than those with ΛK pair production. There are 15 figures and 2 tables.

Title : A Simple Method of Controlling the Acacia Pseudoscale
Insects.

Orig Pub : Sad i ogorod, 1957, № 2, 75.

Abstract : The young pseudoscale larvae attach themselves to the bark of older branches for wintering. In the spring when the average temperature is above 8° they move to young branches to get their steady nourishment. Prior to moving the larvae on the crowns (especially on the periphery) were carefully sprayed with a 10-12% emulsion of freshly slaked lime. The lime crust formed on the bark prevented the larvae from adhering to the bark. Spraying after the larvae attached themselves in the spring was not effective.

ABSTRACT : The greatest affection of apple trees with black canker
has been noted toward the end of their ontogenesis when
the vital functions of the trees are weakened and the de-
velopment of the infection during this time proceeds
especially intensively. In early spring, it is recom-
mended to perform the cleaning up of the wounds as far as
the healthy tissue with their subsequent disinfection.
The cleaning up should be done in the period preceding
*) Cultivation, Viticulture, and Wine Making.
