

Foam Plastics; Collection of Articles

SOV/4207

Poplov, V.A. and V.A. Konrat'yeva. Foam Plastic Sheets Based on Phenol Formaldehyde Resin and Its Combinations With Rubber and Fillers

91

This is a detailed study of foam plastic sheet production based on phenol formaldehyde lacquer resin (foam plastic sheet FF) and on combinations of this resin with acrylnitrile (foam plastic sheet of the FK type). In the Soviet Union these foam plastics are produced by the non-pressure method and are among the most commonly used products.

Khimenko, G.S., V.A. Popov, S.L. Fleyshman, K.P. Gorskiy, and G.M. Smolentsev. Application of Foam Material FK-20-ST in the Manufacture of Antenna Reflectors of Aircraft Radio Electronic Equipment

109

This study data on the physical, mechanical, and dielectric properties of foam material FK-20-ST. It also includes data on the design of antenna reflectors, the molds for reproducing such reflectors, and their fields of application. It is concluded that antenna reflectors made from foam material can be produced at a lower cost than from metal.

Kafengauz, A.F. and Ye. I. Yudicheva. Production of Gas Filled Polyurethanes

117

This study describes the technology of producing gas filled polyurethanes, the properties of polyurethanes, and fields of application. It also includes data on the polyesters, diisocyanates, catalysts, and emulsifying agents used in the production of gas filled polyurethanes.

This study contains data on the technology of producing radomes and dielectric grating reflectors for antenna installations. It also includes data on various ways of filling the structures with foam material

Borodin, M.Ya., and Z.I. Kazakova. Foam Plastic Sheets From Organic Silicon 157

This study contains data on the production technology and properties of foam plastic sheet K-40 made from organic silicon. High thermal stability and good dielectric and heatproof properties make this foam plastic suitable for applications in the field of radio engineering and heat insulation at temperatures of 200-250° up to 500 hours and at temperatures of 300-350° up to 50 hours.

Losev, I.P., D.A. Kuznetsov, and V.D. Valgin. Foam Plastic Sheets Based on Polyepoxy Resins With Aromatic Diamines

167

This study contains experimental data on the production technology and properties of foam plastic sheets made from polyepoxy resins with aromatic diamines. It also includes data on the interaction of such

PLATE I BOOK EXPLANATION Sov/Russ

Preparation of Technical Polymer Form Plastic. Collection of Articles. Moscow.

Ed.: A.A. Kholopov. Consultants of Technical Sciences: V.P. Pavlyuk and M.F. Borodin.

Managing Ed.: A.S. Zaytsevsky. Institute Ed. of Publishing House: I.M. Sverdlov.

Publishing: This book is intended for engineers and scientists planning and manufacturing products and structures using light-weight fibers, and for workers of

the form plastic industry.

CONTENTS: The volume contains 13 studies on form plastic and forming agents. Some of the studies provide data on the technology of producing form plastics (form rubber compositions, polyurethane foam, polyvinyl foam, polyester foam, and form plastic agents based on organic silicon resins). Other studies contain data on the composition of form plastic agents for glass, thermosetting resins and volumetric gel, on the physical, mechanical, and dielectric properties of form plastic, and on the fields of application of form plastics. Several studies deal with alternative plastic. It is stated in the foreword that former Union Provinces and cities from plastic agents based on thermoplastics and unsaturated polymers of rigid, elastic, foamy, and porous structures. It also discusses problems of organics but the authors cite Soviet and other authorities including A.A. Berlin, the author of *Organic Polyesters*, Dr. N. S. Lissengay, *Polymer Plastics* (a collection of articles on the production of gas-filled plastics and elastomers) published by Goskibizdat in 1958.

REPORTS: V.I. Balon. Form Plastic Sheets

This study presents experimental data on the physical and mechanical properties of polyurethane form produced using four different forming agents. It describes the properties of the forming agents, the composition of the form plastic agents, and forming conditions for different compositions.

REPORTS: V.I. Balon. Form Plastic Sheets

that fully presents experimental data on hollow and compact form plastic sheets. It is concluded that certain types of form can be used as filter bags and cast or the product.

BALON, V.I. and V.I. Pavlyuk. Making Products From Polyurethane Form Using

Form Rubber Agents. These following conclusions were reached: 1) polyurethane form with polymer requiring no mechanical processing can produce a reduced depth and diameter

and number parts is suitable for products of reduced depth and diameter

requiring no mechanical processing or any processing of the inner

surface; 2) the physical and mechanical properties of this form do not differ from those of form plastic sheet but, except in specific aspects

strength which is approximately two times lower than in the form plastic sheet; 3) the high stability of form and a number factors permits

reducing the cost of form plastic agents and consequently reducing the cost of the

finished product; 4) polymer and rubber parts

can be joined by heat.

REPORTS: V.I. Balon and V.I. Pavlyuk. Form Plastic Sheets Based on Phenol-

Formaldehyde Resin and Its Combinations With Rubber and Fillers

This is a detailed study of form plastic sheet production based on phenol-formaldehyde resin, form plastic sheet (PP) and on

combinations of these resins with methylmethacrylate (form plastic sheet or PMMA).

In the Soviet Union these form plastics are produced by two

methods: solution method and emulsion method.

AUTHORS: Rogov, L. V., Pavlov, V. V.

TITLE: Production of foam polystyrene by means of various foaming agents

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 9, 1962, 592, abstract 9P51 (Sb. "Penoplastmassy", M., Oborongiz, 1960, 45 - 49)

TEXT: A method was developed for producing foam plastics (FP) with a density of 0.03 to 0.1 g/cm<sup>3</sup>, usable up to 70°C, based on polystyrene emulsion and formed by the use of foaming agents 5, 18, 254, and E4 (BSC) (π<sub>c</sub>-18(PS-18) with γ = 0.03; π<sub>c</sub>-E4(PS-BSC) with γ = 0.05; π<sub>c</sub>-5(PS-5) with γ = 0.06; π<sub>c</sub>-254(PS-254) with γ = 0.1). The PS-18 having a homogeneous fine-pored structure and a good surface was the best of the FP so obtained. To produce FP, polystyrene is mixed in ball mills for 14 - 18 hr, with the corresponding amount of foaming agents. The finished mixture is screened through a silk sieve no. 30, then compressed at 100°C under 100 - 150 atm. The semiproducts are foamed at 98 - 100°C for 3 - 4 hr in

TITLE: Technology and properties of expanded polystyrene radomes

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 12, 1961, 43, abstract 12I241 (V sb. "Penoplast-massy", M., Oborongiz. 1960, 64-80)

TEXT: Expanded polystyrene with its exceptionally high and stable electrical properties was one of the first foam plastics which attracted the attention of investigators developing radomes. It is known that polystyrene can be given a foamed structure by various methods, but for radomes the best is pressing which produces an expanded material of the greatest strength, with a homogeneous small-cell structure. For a long time, however, it was not possible to use expanded polystyrene for radomes because of their specific properties (large dimensions, thin walls, complex shape) and because suitable technological production methods did not

TITLE: On the interchangeability of design parts by parameters

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Mashinostroyeniya,  
no. 12, 1962, 115-122

TEXT: The author considers several aspects of the analysis of the problem of interchangeability as a whole utilizing several concepts of the general theory of sets and functions. Such an approach permits a unique classification of the parameters of the elements of construction and a definition of the concepts of absolute, complete, and limited interchangeabilities. The author suggests the use of superposed graphs of interrelationships between the errors in the parameters of the elements as an aid in the solution of problems of interchangeability of specific elements of construction.

AUTHOR: Pavlov, V. V., Popel', S. I., Yesin, O. A.

TITLE: Calculation of the surface tension of liquids from the excess isochore-isotherm potential. III. Molten salts and metals

PERIODICAL: Zhurnal fizicheskoy khimii, V. 37, No. 4, 1963, 797-801

TEXT: With the use of the excess isochore-isotherm potential an equation is derived which correlates the surface temperature of ionic liquids with the temperature, volume, and saturated vapor pressure. Thus

$$\sigma = 0.157 (1 + 88)T \frac{4.58 + \lg(T/V) - \lg P}{V_{\text{liq}}^{2/3}} \quad (7)$$

Here T is the temperature; V is the volume; and P is the saturated vapor pressure. The values for  $\sigma$  and  $d\sigma/dT$  calculated for molten salts are in satisfactory agreement with the experimental data. An equation derived earlier for molecular liquids can be applied to estimate the surface tension of metals which have a simple cubic structure. The equation is

TITLE: "Enclosed" Type Press Moulds (Press-formy zak /togo  
tipa)

PERIODICAL: Kauchuk i rezina, 1959, Nr 2, pp 41-43 (USSR)

ABSTRACT: Rubber components (cord rings etc.) for machine construction which are required to operate at high temperature and under arduous conditions are not always satisfactory when pressed in the usual type of "open" or "partially enclosed" moulds as shown in Figs 1 and 2. Components from such moulds have a large amount of flash - amounting to 10 to 20% of the weight of the part, and much more in case of very small components. Besides the pressure is not maintained on the component since the flash holds the mould halves apart. The "enclosed" type of mould, shown in Fig 3, limits the amount of flash or flow-out to 0.8% to 2.0% of the weight of the component because there is internal and external vertical cylindrical confinement, as well as a horizontal confinement and the pressure is applied to virtually the true horizontal projected area of the component. Pressure distribution in these three types

TITLE: Quantitative spectrographical determination of indium in some alkali-halogen crystal phosphors

PERIODICAL: Referativnyj zhurnal. Fizika, no. 5, 1962, 19, abstract 5G179 ("Sb. nauchn. rabot Kafedry optiki i Kafedry eksperim. fiz. Kazakhsk. un-t", 1960, no. 2, 145-153) /B

TEXT: Results are presented on the determination of In concentration in the alkali-halogen crystal phosphors NaCl-In, KCl-In and KBr-In prepared by the method of thermodiffusion from the gaseous phase. The concentration of In in NaCl, KCl, and KBr, containing and not containing non-activating ions Sr<sup>2+</sup> and Ca<sup>2+</sup>, was varied by the duration of heating the evacuated ampoules with the components of phosphors. The quantitative determination of In was carried out by photographic photometry of the spectral lines of In with wavelengths 3039.36 and 3256.1 Å and standard element (Li) by the method of three standards. The obtained data were used to verify some principal assumptions of the process of formation of crystal phosphors.

AUTHOR: Pavlov, V. Ye.

TITLE: The atmospheric scattering indicatrix in the region of small and large scattering angles

SOURCE: Astronomicheskiy zhurnal, v. 41, no. 1, 1964, 122-127

TOPIC TAGS: astronomy, astrophysics, atmosphere, scattering, scattering indicatrix, atmospheric scattering

ABSTRACT: The article discusses the results of a study of the atmospheric scattering indicatrix on the basis of sky brightness measurements at solar almucantar in the absence of a snow cover. The observations were made in the summer of 1962 on the territory of the Astrophysical Institute of the Kazakhstan Academy of Sciences and in a semidesert environment on the banks of the River Ili. The stability of the optical properties of the atmosphere was controlled by observations with the Fesenkov aureole photometer. The article discusses, specifically: 1) the atmospheric indicatrix at small scattering angles; 2) the effect of the circumsolar aureole on the computation of optical thickness by the scattering indicatrix; 3) the light scattering indicatrix in the Earth's atmosphere at large scattering angles. As a basis for their reasoning, the authors assumed that if one selects

Cord 1/3

ACCESSION NR: AP4017624

as a scattering volume an atmospheric column with unit base and height equal to the height of the atmosphere, then according to measurements at solar almacantar it is possible to determine the directional scattering factor, calculated for the entire atmosphere

$$\mu(\theta) = \frac{B(\theta)}{E_0 \cdot P^m m}, \quad (1)$$

where  $B(\theta)$  is the brightness of the sky at an angular distance  $\theta$  from the Sun;  $E_0$  is the illumination of an area perpendicular to the Sun's rays, at the limit of the atmosphere;  $P$  is the transparency factor of the atmosphere;  $m$  is the atmospheric mass in the direction of the Sun. It is shown that, in the region of small scattering angles, the elongation of the indicatrix increases as the wavelength increases and as the absolute value of the circumsolar aureole increases. "In conclusion, the authors wish to express their gratitude to Ye. V. Pyaskovskaya-Fesenkova for her formulation of the problem of the investigation, and to P. N. Boyke, with whose assistance the observations of the scattering indicatrices were carried out in the semidesert area in the vicinity of the Ili River and who also provided a scattering indicatrix which he obtained on the top of Mount Kumbel'." Original article has: 8 figures and 4 formulas.

PHOTOELECTRIC SELF-RECORDING DAY-SKY PHOTOMETER (USSR)

Pavlov, V. Ye. IN: Akademiya nauk Kazakhskoy SSR. Astrofizicheskiy institut. Trudy, v. 3, 1962, 62-65. S/913/62/003/000/008/033

A photoelectric photometer capable of measuring the distribution of sky brightness in the almucantar of the sun from  $\theta = 1.5^\circ$  to  $\theta = 180^\circ$  has been constructed for the purpose of 1) studying the indicatrix of scattering at small scattering angles, 2) measuring indicatrices of scattering in an optically unstable atmosphere, and 3) improving the accuracy of computation of the optical depth and coefficient of asymmetry of scattered light flux. The tube of the photometer has a diameter of 40 mm and a length of 600 mm; it is equipped with diaphragms that delineate a solid angle of  $36'$  without penumbra, or  $48'$  with penumbra. An CGY-27 photomultiplier serves as radiation receiver. Interference light filters with wavelengths  $\lambda = 447, 550,$  and  $630 \text{ m}\mu$  define the spectral region. The signal from the photomultiplier is delivered first to a four-tube d-c amplifier and then to an MIO-2 loop oscilloscope. The photometer rotates automatically in an azimuthal direction at the rate of four revolutions per minute.

TITLE: Absorption of light by atmospheric aerosols

SOURCE: Ref. zh. Astronomiya, Abs. 7. 51. 197

REF SOURCE: Tr. Astrofiz. in-ta. AN KazSSR, no. 7, 1966, 85-90

TOPIC TAGS: aerosol, light absorption, optic thickness, scattered light, light intensity

ABSTRACT: A laboratory method of separating the optic thickness of scattering and absorption which does not require the measurement of indicatrices has been developed. Past and scattered light is registered. The ratio of this sum to the incident luminous flux represents the coefficient of layer transparency which characterizes the extinction caused by pure absorption. An Ulbricht sphere is used in the system of the light collecting element. Light intensity in the visible and IR regions was registered by photomultipliers through interference filters. Absorption in aerosols was calculated during multipole reflection of light from the sphere. Particles of soot, lava, meteorites, graphite, clay, sand, etc., have

Card 1/2

UDC: 525.7

L 10y01-07  
ACC NR: AR6033091

been investigated. The presence of sand, clay, cement, or rock dust does not cause a noticeable increase in pure absorption. Soot and coal cinder possess high values of pure absorption. Growth of pure absorption with decrease in wavelength is typical for many aerosols. The Forbes effect and the shallow absorption band in the blue part of the daylight sky spectrum may be caused by this growth.

TITLE: A hydraulic <sup>1</sup> drive of reciprocating motion. Class 47, No. 177731

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1966, 124

TOPIC TAGS: hydraulic device, hydraulic equipment, hydraulic liquid, clutch

ABSTRACT: This Author Certificate presents a hydraulic drive of reciprocating motion, containing a working cylinder, a jet tube for consecutive feeding of working liquid into the chambers of the hydraulic cylinder, and a mechanical feedback for directing the jet tube according to the position of the piston of hydraulic cylinder (see Fig. 1). To simplify its construction and to increase its productivity, the feedback mechanism is made in the form of a two-shoulder lever rigidly fixed to the shaft attached to the shank of the jet tube through a friction clutch. One end of the lever is connected to a spring-loaded rod, while the other end is connected to a key-like protrusion formed on the rod, and insuring a passing of the jet tube from one position into another.

TITLE: A regularity in atmospheric light scattering

SOURCE: Astronomicheskiy zhurnal, v. 43, no. 4, 1966, 889-890.

TOPIC TAGS: atmospheric scatter, optic brightness, optic thickness

ABSTRACT: The article considers the applicability of day sky brightness tables computed on the assumption of isotropic light scattering in the atmosphere, to the integration of observation data at an angular distance  $\theta = 57^\circ$  from the sun. Tables for the brightness of the sky were used to compute the absolute brightness indicatrixes and graphic integration was used to determine the quantity:

$$\tau = 2\pi \int_0^{\pi} \mu(\theta) \sin \theta d\theta.$$

The computed results are compared with the results of direct measurements to show that the tables of day sky brightness can be successfully used to interpret observed data at an angular distance  $\theta = 57^\circ$  from the sun in the interval of optical thickness  $\tau_1 \leq 0.8$ .

TITLE: A Machine for Testing Plastics at Complicated Stress States

PERIODICAL: Nauchno-tekhnik. inform. byul. Leningr. politekhn. in-t., 1959, No. 4,  
pp. 63-65

TEXT: A device is described which can be put in the clamps of the machine MM12A (IM12A) for testing plastics at complicated stress states. A tubular plastic specimen can be subjected in the testing process to the action of internal and external pressure with simultaneous stretch. The device consists of a hollow steel housing; the knob of the upper cap of the housing is put in upper clamp of the testing machine. The upper end of the specimen rests in slotted spherical sockets which are placed in a special nut attached to the upper part of the housing. The lower end of the specimen is attached to the movable rod by a nut; the lower end of the rod is connected with the lower clamp of the test machine by means of two nuts. The spherical surfaces of the nuts assure the hinge joint of

PHASE I ' BOOK EXPLOITATION SOV/3163

Pavlov, Yakov Mikhaylovich, Candidate of Technical Sciences,  
Docent

Detali mashin (Machine Elements) Moscow, Mashgiz, 1958. 511 p.  
85,000 copies printed.

Reviewer: G.M. Itsikovich, Engineer; Ed.: V.S. Polyakov, Candidate of Technical Sciences, Docent; Ed. of Publishing House: N.Z. Simonovskiy; Tech. Ed.: R.G. Pol'skaya; Managing Ed. for Literature on the Design and Operation of Machinery (Leningrad Division, Mashgiz): F.I. Fetisov, Engineer.

PURPOSE: This textbook is intended for students of machinery tekhnikums.

COVERAGE: The book deals with methods of designing and constructing such general-purpose machine parts and transmissions as gears, drives, and joining elements. Information is given on fits and tolerances, hoisting mechanisms, and design work. No personalities are mentioned. References follow each chapter.

Machine Elements

SOV/3163

TABLE OF CONTENTS:

Preface	3
Symbols	5
Introduction	
I. The importance of the course, Machine Elements	7
II. Basic trends in the development of machine building	7
III. Brief historical data on the course, Machine Elements	8
	12

PART ONE. BASIC INFORMATION

Ch. I. Materials Used in Machine Building	
1. Cast iron	15
2. Steel	15
3. Copper and copper alloys	17
4. Substitutes for metals	21
	24
Ch. II. Design, Calculation, and Construction	
1. Forces and deformations	26
Card 2/14	27

Machine Elements

SOV/3163

2. Classification of stresses	28
3. Limit of endurance of metals	31
4. Effect of dimensions of a part on the endurance limit	35
5. Effect of local stresses on the strength of parts	35
6. Safety factors and allowable stresses	35
7. General requirements for machine parts	41
	48

PART TWO. TRANSMISSIONS

Ch. I. Friction Gearing

1. Gearing with parallel shafts and cylindrical wheels	53
2. Gearing with parallel shafts and grooved wheels	54
3. Bevel friction gearing	57
4. Brief résumé of information on variable-speed drives	58
	59

Ch. II. Spur Gearing

1. Elements of tooth gearing	63
2. Basic theorem of tooth gearing	64
3. Construction of involute-tooth form	65
4. Rack and pinion	67
	68

Card 3/14

Machine Elements

SOV/3163

5. Tooth shape at 15° and 20° pressure angles	70
6. Module of a gearing. Pinion and gear diameters	70
7. Gear ratio	70
8. Line of action	71
9. Selecting the minimum number of teeth	72
10. Selecting the face width of a tooth	74
11. Operating conditions and materials for gears	77
12. Basic equation for designing gears for beam strength	79
13. Stress concentration in teeth	80
14. Allowable (design) stresses in tooth calculations for endurance at bending	82
15. Allowable limit (maximum) stress in check calculations of teeth for plastic deformation or brittle fracture by bending	83
16. Determination of the design load and module of a gearing from the beam strength	85
17. Design of teeth for contact strength	85
18. Allowable (limit) stresses	87
19. Helical and herringbone gears	91
20. Manufacture of gear teeth	91
	101

Card 4/14

Machine Elements

SOV/3163

Ch. III. Bevel Gearing	
1. Construction of bevel gearing	107
2. Approximate method of constructing tooth profiles	107
3. Gear ratio and number of teeth	108
4. Determining face width of teeth and module and diameter of gears	109
5. Design of teeth for contact strength	111
6. Forces in bevel gearing	114
7. Methods of gear cutting	115
8. Gears on nonintersecting nonparallel shafts	116
9. Efficiency of gear trains	119
Ch. IV. Constructions of Gears	
1. Metal gears	121
2. Nonmetallic gears	121
Ch. V. Worm Gearing	125
1. General information	127
2. Types of worms and worm gearing	127
	128

Card 5/14

Machine Elements

SOV/3163

3. Gear ratio	
4. Efficiency of a screw. The lead angle	130
5. Selecting the number of teeth for a worm gear	131
6. Materials and allowable stresses	132
7. Determination of the module from bending stresses	133
8. Design of a worm gearing for contact strength	133
9. Determination of dimensions of worm and gear	135
10. Forces in worm gearing	138
11. Design of shafts for worm and gear	141
12. Cutting worms and wheel teeth	143
13. Bearings for worm gearing	145
14. Arrangements of worm gearing	146
15. Lubrication	149
16. Efficiency of worm gearing	150
17. Calculating worm gearing for heat generation	151
Ch. VI. Belt Drives	152
A. Flat belt drives	158
1. Diagram of a belt drive	158
2. Pressure on bearings. Different types of flat belt drives	158
	159

Card 6/14

Machine Elements

SOV/3163

3. Flat belt drives with idler pulleys	161
4. Determination of forces in driving and driven sections	162
5. Slippage of belts	164
6. Materials and types of flat belts	166
7. Belt joints	168
8. Stresses in a belt, belt length, and center distance	168
9. Design of belts by means of slippage curves	170
B. V-belt drives	175
10. Properties of V-belt drives	175
11. Types of belts and design of the drive	177
12. Groove dimensions for V-belts	181
C. Belt-drive pulleys	182
13. Constructions	182
14. Design of a pulley	187
Ch. VII. Chain Drives	195
Ch. VIII. Speed Reducers	200
1. General information	200

Card 7/14

Machine Elements

SOV/3163

2. Gear ratio and number of reductions in a unit	204
3. Arrangement and elements of a geared reducer	207
4. Arrangement of a worm-gear reducer	213
5. Some parts and elements of reducers	213

PART THREE. TRANSMISSION ELEMENTS

Ch. I. Journals

1. Determination of the bearing reaction of an axle	221
2. Design of end journals	221
3. Types of journals	222
4. Vertical journals	226
	228

Ch. II. Axles and Shafts

1. Axles	233
2. Schematic diagram of a shaft and the forces applied to it	233
3. Design of a shaft for torsion	236
4. Design of a multibearing transmission shaft	237
5. Design of a shaft under torque and bending forces	238
	240

Card 8/14

Machine Elements	SOV/3163
6. Characteristic features of designing shafts loaded with torques and bending and compression forces	245
7. Design of a shaft for torsional rigidity	247
8. Check of the rigidity of a shaft during bending	249
9. Hollow shafts and axles	250
Ch. III. Radial and Thrust Bearings	
A. Sliding-contact bearings	260
1. Solid bearings	260
2. Split bearings	260
3. Bearing bushings	261
4. Methods of lubrication	262
5. Self-aligning bearings	263
6. Concept of the hydrodynamic theory of friction in bearings	267
7. Direction of pressure on bushings. Lubricant supply	268
8. Sliding-contact thrust bearings	273
9. Materials for bushings	273
B. Rolling-contact bearings	274
10. Basic types	276
11. Review of rolling-contact bearings	276
12. Selection of ball and roller bearings	276
Card 9/14	281

Machine Elements	SOV/3163
13. Brackets for bearings	284
Ch. IV. Couplings and Clutches	
1. Rigid fixed couplings	287
2. Rigid split couplings	287
3. Rigid jaw clutches	288
4. Flexible couplings	290
5. Torsionally flexible couplings	292
6. Friction clutches	294
7. Safety clutches	301
8. Accessories for engagement of clutches	306
	308

PART FOUR. MACHINE-PART JOINTS

Ch. I. Bolted and Screwed Joints	
1. Construction of helixes	309
2. Construction of thread forms and systems	309
3. Force relationships and efficiency of screw couples	310
4. Comparative valuation and selection of threads	312
	316

Card 10/14

Machine Elements

SOV/3163

5. Design of bolted joints	321
6. Determination of the height of a nut	329
7. Design of a bolt with eccentric load	331
8. Design of a bolt with shear forces	332
9. Method of relieving bolts and screws from shear forces	333
10. Studded joints	334
11. Manufacturing and constructional factors affecting bolt strength	335
12. Foundation bolts	338
13. Design of a group-bolt joint	340
14. Translating screws	343
15. Clamped joints	352
16. Locking of threaded fasteners	353
17. Design examples	356
Ch. II. Cotter and Key Joints	
1. Cotter joints	367
2. Key joints	367
3. Check calculation for a key	371
	376

Card 11/14

Machine Elements

SOV/3163

4. Spline joints	377
5. Pin joints	379
Ch. III. Riveted Joints	
1. The process of making a joint	381
2. Types of rivets	381
3. Riveting methods	382
4. Classification of riveted joints	383
5. Design of lap joints	385
6. Design of strong joints with two cover plates	387
7. Permanent rivet-type joints	390
8. Tight joints	390
9. Strong-and-leakproof joints	393
10. Design examples	394
	403
Ch. IV. Welded Joints	
1. Types of welded joints	409
2. Butt welds	409
3. Fillet welds	412
4. Allowable stresses	414
Card 12/14	415

Machine Elements

SOV/3163

PART FIVE. TOLERANCES AND FITS. COURSE DESIGN PROJECT

Ch. I. Tolerances, Fits, and Interchangeability	423
1. Dimensions, fits, system of tolerances	423
2. Degrees of accuracy	427
3. Limit gages	427
4. Surface roughness	428
5. Concept of interference fits	429
	430
Ch. II. Course Design Project	432
1. General remarks	432
2. Problem. The number of reductions in a speed reducer	433
3. Distribution of the total ratio among reductions	434
4. Efficiency of a reducer, and horsepower rating of an electric motor	434
5. Speed and the power rate on shafts of a reducer	435
6. Determination of basic dimensions of a gearing	437
7. Design of shafts, selection of bearings, and the switch of the reducer	438
8. General view of the installation	441
9. Explanatory note	441

Card 13/14
