Title : Determination of Silicones on Fabrics Which Have Been  
Subjected to Water-Proofing.

Orig Pub : Textil (cescocl.), 1957, 12, 11, 422-423

Abstract : The silicone content is determined by a modification of  
Petti's method as follows: A fabric sample (5-10g,) and 30 ml of conc. sulfuric acid are placed into a 200 ml vessel (made from a borosilicate glass) equipped with a lid and a reflux condenser. The vessel is tightly closed and through the upper condenser's opening 10 ml of 65% nitric acid is poured. The contents are mixed by rotating the vessel and 35 ml of nitric acid is added in 10 ml portions with agitation. Upon mixing the solids,

the temperature increases and the sample is dissolved. When fuming ceases, the vessel is placed on a wire gauze triangle and the solution is gradually heated to boiling, and is kept at that temperature for 20 minutes, after which time the vessel and its contents are cooled. Ten ml of nitric acid (65%) and 2 ml of  $\text{HClO}_4$  are added and heated on the wire gauze for 20 minutes, whereby the color of the mixture changes from black to an orange-brown color. At that point, the heating is interrupted and 10 ml of nitric acid and 2 ml of  $\text{HClO}_4$  are added, followed by continuing heating. The operation is repeated until the solution becomes either colorless or light yellow. The condenser is washed with a small amount of nitric acid and is removed; the lid is washed in the same way. The vessel with its contents is covered with a watch glass (borosilicate glass) and is heated on the

Title : The Problem of the Determination of Starch Con-  
tent in Cellulose Fabrics

Orig Pub. : Textil (Czechoslovakia), 12, No 12, 462-463 (1957)

Abstract : The starch (I) deposited on cellulose fabrics  
[rayon fabrics] is removed by treatment with 20%  
urea for 30 min at 95° (repeated 3-4 times) or  
with a 1.5 sp gr CaCl<sub>2</sub> solution acidified with  
4 ml 50% CH<sub>3</sub>COOH (per liter). The filtrates con-  
taining the solubilized I are transferred to a  
250 ml volumetric flask and diluted with water up  
to the mark; an amount of solution corresponding  
to a I content of 1.5-3.5 mg I is transferred  
to a 100 ml volumetric flask. 50 ml distilled  
water, 2.5 ml 2 N CH<sub>3</sub>COOH, 0.5 ml of freshly  
prepared 10% KI solution, and exactly 2 ml of  
0.05 N KIO<sub>3</sub> solution are added, the solution is

Title : A Simplified Method for the Rapid Determination of PVC Content in Specially Finished Fabrics  
Orig Pub. : Textil (Czechoslovakia), 13, No 7, 266-268 (1958)  
Abstract : A large piece of the finished fabric (about 50 gms) is cut into small 2 x 2 mm squares; a 0.5-2 gms sample is used. The sample is placed in an Ni crucible (diam 40 mm, height 50-60 mm) the bottom of which has been covered first with a 5 mm layer of a mixture of 2 N NaOH and 1 N KNO<sub>3</sub>. The sample is carefully mixed with the above mixture and the resulting mixture is covered with NaOH-H<sub>2</sub>O<sub>2</sub> mixture (10-15 mm), after which the crucible is heated for 2-3 min. Following the heating the crucible is allowed to stand [time not indicated] and then placed in a narrow 600 ml flask, distilled water is added, and the melt is dissolved; the crucible

Title : New Method of Production of Carbon Dioxide for Soda  
Industry.

Orig Pub: Rev. chim., 1958, 9, No 1, 13-18.

Abstract: The economical advantages of using natural gas and  
enriched  $O_2$  as fuel instead of coke for the decomposi-  
tion of limestone are described. It is shown with a  
heat balance that the use of  $O_2$  makes it possible to  
raise the temperature of the flame, to decrease the  
losses of heat, and to increase the rates of combustion

Mathematical discussion of the application of Hess' law.  
A. Pethe and G. Schay (Tech. Univ., Budapest). *Adv.  
Chem. Phys. Ser. Hung.* 4, 21-38 (1964) (in German).—Sets  
of thermochem. equations are examd. on the basis of the gen-  
eral properties of sets of linear equations. The matrix  $\Delta$  of  
the stoichiometric nos. occurring in the set gives the  
necessary and sufficient condition for the unambiguous  
solvability with respect to the unknown heat of reaction.  
If such a soln. exists, it can always be achieved by the usual  
procedure, i.e. simple addn. of the equations multiplied by  
suitable coeffs. A straightforward method is outlined by  
which these coeffs. can be directly detd. even in the case of  
complicated sets of equations. J. R. Schwartz

7. Application of dimensional analysis for gas state equations having 3 constants. (In German) A. Fethéő. *Periodica Polytechnica, Chemical Engineering*, Vol. 1, 1957, No. 3, pp. 199-202

A general form of equations of state for gases with 3 disposable constants has been derived by the methods of dimensional analysis where interaction between the molecules is characterized by a constant  $a$ , the actual volume of the molecules by a constant  $b$ , the ideal behaviour of the gas when  $P \rightarrow 0$  being taken into account by the constant  $k$ . If the nature of the interactions is not known in detail the dimension of  $a$  is (expressed in terms of the dimensions of pressure, volume and temperature)  $[a] \sim [P]^{x_1} [V]^{x_2} [T]^{x_3}$  where the values of  $x_1$ ,  $x_2$  and  $x_3$  depend on the choice of the molecular model and  $[k] \sim [P] [V] [T]^{-1}$  and  $[b] \sim [V]$ . Thus the general form of the equation of state is

$$P = \frac{RT}{V} \sum_m \sum_n C_{mn} V^{(x_1-x_2)m-n} (RT)^{-x_1 m} T^{-x_2 m} a^m b^n$$

where the  $C_{mn}$  expressions are dimensionless arbitrary numbers. The equations of state of van der Waals and Dieterici are derived as special cases. Finally a conclusion following from the application of dimensional analysis is given for proving the transformability of 3-constant equations of state into their reduced forms.

TITLE: Distribution of Na in the blood and cerebrospinal fluid [This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July, 1964]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement, 23

TOPIC TAGS: sodium, hematoencephalitic barrier, calcium, magnesium, central nervous system, animal physiology

ABSTRACT: The distribution of Na on both sides of the blood-CSF barrier has been studied in response to infusion of K, Ca and Mg salts. The total molarity of plasma and CSF remained almost unchanged during the experiments. The plasma K, Ca and Mg concentrations increased by a total of 11 meq/kg H<sub>2</sub>O while the increase in the concentration of the same cations was less than 1 mEq/kg H<sub>2</sub>O in the CSF. The plasma Na level decreased by 11 meq/kg H<sub>2</sub>O in response to the infusion

Card 1/2

L 14885-66

ACC NR: AT6007399

while no change in the Na level of the CSF was observed. Although the K, Ca and Mg levels in the CSF increased only slightly and did not follow the changes in plasma concentration, the relationship was linear in the case of K and Mg. The Ca concentration of the CSF remained virtually unchanged. The plasma values calculated on the basis of the DONNAN equilibrium and the Na levels estimated in the CSF were in good agreement. It is suggested that the distribution of Na may be based on the membrane equilibrium.

Carbohydrate metabolism in fasting newborn and suckling pig - fasting hypoglycemia. A. Kerpely, Zs. N. Gáspár, Gy. Pethes, B. Tóth, and D. László (Inst. Physiol. Vet. Fac., Budapest). *Acta Vet. Acad. Sci. Hung.* 5, 115-30 (1955) (in English). - Litters of newborn and suckling pigs were submitted to inanition after 10, 24, 36, and 96 hrs. nursing, resp. The surviving time was observed. The blood sugar level and inorg. phosphate and lactic acid content of the blood were correlated with weight loss and body temp. fall. The blood sugar level fell gradually and death was not always assoc. with hypoglycemia. The inorg. phosphate increased and reached levels 30% above normal. Blood lactic acid fell. The normal basal metabolic rate of baby pigs was found to be 8.7 kcal./kg./hr. C. J. Carr
