TITLE: A device for the running control of electric voltages and currents. Class 21, No. 183258

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 36-37

TOPIC TAGS: electric current, electric measuring instrument, automatic control system

ABSTRACT: This Author Certificate presents a device for the running control of electric voltages and currents with different tolerances which are defined on the basis of a program. The device is self-adjusting in respect to a reference and includes a commutator, a program unit, an analog-digital converter, and a device for storing the zero signal (see Fig. 1). The design provides for self-adjustment of the system on the basis of two combined characteristics for the purpose of increasing the precision and stability of control. The device includes a nullifying unit for the voltage, which consists of two coincidence circuits connected through inverters with two filters. The inputs of the filters are connected, through emitter followers and a calculating device, to the regulator of the compensating current increase in

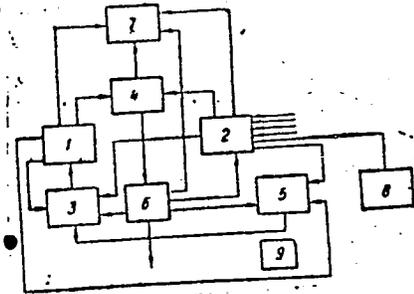

Fig. 1. 1 - switching unit of the reference resistances; 2 - switching unit of the parameters; 3 - zero unit; 4 - program comparison unit; 5 - nullifying unit; 6 - control unit; 7 - signaling unit; 8 - reference source; 9 - power supply unit

the zero unit. The current nullifying unit (which consists of two coincidence circuits) is connected with the control output of the trigger. The output of the trigger is connected, through the filter and emitter follower, to the regulator of the input potential of the zero unit. Orig. art. has: 1 figure.

Yeast (*Saccharomyces pasthoriensis*) as a source of vitamin-D. E. P. KRATKOVA and A. I. POONIL (Probl. Mikrobiologiya, 1985, No. 9, 98-100).— Treatment with yeast resulted in increase in the N content ofilage. Increase of vitamin-D content occurred only after irradiation of the yeast. Total yeast was the most satisfactory in laboratory experiments and in feeding experiments with chickens. Of the different foods illaged, penicillin was most satisfactory. Use of the food treated with yeast lowered the % of scabitis, chickens and the general mortality. NUTR. ABS. (m)

**Expanded state and binary films.** S. R. Hilder and P. F. Pechl (*Acta Physicochim. U.R.S.S.*, 1911, 10, 65-101).--  
 The properties of binary films, consisting of a surface-active substance and a long-chain hydrocarbon, have been studied. Solid hydrocarbons are completely extruded from the film, but liquid hydrocarbons give a homogeneous film with 2-8 mols. of hydrocarbon per mol. of active substance. In presence of the hydrocarbon ("two-dimensional solvent") the discontinuous expansion point disappears, and on compression the val. for the limiting area per mol. is  $\approx 2$  for the ordinary film, and is equal to that in the crystal. The interpretation of these results, and also the thermodynamics of the expansion, considered as a phase change of the second kind, are discussed. F. J. G.

"Investigation of Some Complex Compounds of Cadmium and Zinc by the Ion Exchange Method," by I. A. Korshunov, A. P. Pochinaylo, and V. M. Tikhomirova, Chair of Radiochemistry, Gorkiy State University imeni N. I. Lobachevskiy, Zhurnal Neorganicheskoy Khimii, Vol 2, No 1, Jan 57, pp 68-73

By measuring the exchange with ions of radioactive isotopes, the composition and constants of instability of some complex compounds of Zn and Cd ions with oxalate and tartrate ions, and also of Zn ions with thiosulfate and citrate ions, were determined. The characteristics of the complex ions in question are given.

POCHINOK, K.H.M.

A colorimetric ninhydrin method for the determination of amino nitrogen in plants. K.H. M. Pochinok and B. I. Bershtein (Inst. Plant Physiol. and Agrochem., Acad. Sci. Ukr. S.S.R., Kiev). *Ukrain. Biokhim. Zhur.* 28, 354-62 (Russian summary, 362-3) (1958). -- P. and B. present a new modification for the colorimetric detn. of amino N (I) with the aid of ninhydrin in which KCN is replaced by ascorbic acid and the comp. of the org. solvent is changed. By this method 0.7-7 % of I can be detd. in 1 ml. of soln. Ascorbic acid is superior to KCN as a reducing agent in pyridine medium, and prevents the decompu. of the formed colored product by phenol upon heating. The yield of the colored product in the majority of cases varies to a negligible degree, not exceeding 10%. P. and B. believe that their modification can be employed not only in the detn. of individual amino acids, but to their totality in mixts. Conditions are specified for the detn. of I and of the activity of protease in plants. The method for the detn. of I: Grind fresh plant material (not exceeding 0.5 g.) with 70% EtOH; transfer to a 10-ml. marked test tube and make up to vol. with 70% EtOH; stopper tube and mix well; centrifuge; pour off clear supernatant into a clean and dry tube; remove 5 ml. into a 25-ml. volumetric flask; add H<sub>2</sub>O to mark and mix well; place 1 ml. of this into each of several 5-ml. marked test tubes; with the aid of a buret add 2 ml. of 1:1 alc. soln. of phenol and 2 ml. of 5% soln. of ninhydrin; mix well and submerge rack and tubes into boiling water for 10 min.; remove and cool to room temp. for 15 min., shaking the tubes occasionally; add 60% alc. to mark; again shake and make colorimetric estn. at 570 m $\mu$ . Use the following as the zero soln.: to a test tube add phenol, pyridine, ascorbic acid and ninhydrin in strength and quantities as above; add 1 ml. H<sub>2</sub>O and heat; cool concurrently with exptl. test tubes. The photometric results are evaluated with the aid of a calibrated curve and I in mg. % is calcd. by the formula:  $N = 0.1 A \cdot a/b/c \cdot p \cdot n$  in which A = the vol.

2

1/2

POCHINOK, K.H. M. AND BERSHTEIN, B.I.

in ml. of the original soln. in which the specimen was dissolved;  $a$  = the quantity of I in  $\gamma$  present in  $c$  ml. of the studied soln.;  $b$  = capacity of the flask in ml. in which the next soln. is prepd.;  $c$  = number of ml. of the studied soln. prepd. in the flask;  $p$  = the weighed portion in g.;  $n$  = no. of ml. of the original soln. used in the prepn. of the next (final) soln. The procedure for the detn. of the activity of protease: Take 5 g. of the studied plant material; add 1-2 ml. of NH<sub>4</sub>-free water in a mortar and grind well; transfer to a 50-ml. volumetric flask; add H<sub>2</sub>O to mark; mix well; with a pipet remove 10 ml. and place into each of two 100-ml. volumetric flasks; add to each flask 10 ml. of NH<sub>4</sub>-free H<sub>2</sub>O and 5 ml. of phosphate buffer pH 5.8; place one flask into boiling water for 2-3 min. to inactivate the protease; cool and use as control; add to test and to control flasks 15 drops of toluene; stopper and place into incubator at 35° for 20 to 40 hrs. depending upon the type of plant material studied (e.g. potato tubers require a longer time than leaves); remove from incubator; submerge test flask into boiling water for 2-3 min.; cool; add H<sub>2</sub>O to mark to control and to test contg. flasks; mix well; place 10 ml. of each into centrifuge tubes and centrifuge; pour off clear supernatant into clean dry tubes; det. content of I as above described; equate photometric readings with the aid of calibrated curves and calc. protease activity with the aid of the following formula:  $A = (x - b)/p \cdot m$  in which  $A$  = the activity of the protease in  $\gamma$  of I/hr./g. of the material;  $x$  = I in  $\gamma$  contained in 100 ml. of the soln.;  $b$  = I in  $\gamma$  contained in 100 ml. of the control soln.;  $p$  = g. of material in 100 ml. of the test soln.;  $m$  = duration of protease activity in hrs.

The solubility of calcium oxalate. N. A. Ivanov and K. N. Pochinok. *Zhurnal Khim. Fiz.* 1932, No. 4, 12-28; *Chem. Zvest.* 1934, II, 3012-13. — The soly. of  $\text{CaC}_2\text{O}_4$  in  $\text{H}_2\text{O}$  increases regularly with the temp., although above 50° the rate of increase becomes less. In the presence of  $\text{NH}_4\text{Cl}$  the soly. is decidedly greater and increases with concn. and temp.  $\text{NH}_3$  exerts a similar although slight effect. The soly. of the  $\text{Ca}$  oxalate at room temp. is greater in the presence of both  $\text{NH}_3$  and  $\text{NH}_4\text{Cl}$  than in the presence of either alone, but the increase with temp. is slight so that at 45° the soly. is less in the presence of both components than in the presence of  $\text{NH}_4\text{Cl}$  alone.  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  reduces the soly., although at 38° twice as much  $\text{Ca}$  oxalate dissolves in its presence as at 25°, so that in accurate analyses filtration must be done in the cold. It is recommended that in the presence of  $\text{NH}_4\text{Cl}$  large amts. of  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  be added. The application of these results to analyses is discussed. W. A. Moore

The determination of the forms of calcium and oxalic acid in leaves of sugar beets. A. P. Lebedeva and Kh. N. Buchinok. *Nauch. Zapiski Sakharnoi Prom.* 11, Book 46-8, No. 8-10, 31-33 (in English 46-7) (1934).  
 A small portion of Ca from sugar-beet leaves is not extr. even with HCl; young leaves contain a higher percentage of unextractable Ca than the old leaves. No  $H_2O$ - or acetic acid-sol. Ca was found. Water-sol. oxalates were found in quantities equal to 1.5-2 times the quantity of  $CaCO_3$  and young leaves contained more of these than the old leaves. The oxalate content varies in the different parts of the leaf, sometimes the difference being as high as 50 per cent. A micro method for the detn. of  $CaC_2O_4$  in leaves has been worked out. J. S. Joffe

Fractional determination of potassium  $KH_2N$   
 Pashnok, *J. Applied Chem. (U. S. S. R.)* **4**, 521,  
 (in German 527) (1951). The method can be used in  
 the presence of  $NH_4$  but in the absence of  $Rb$  and  $Cs$ .  
 To the soln. to be tested add half of its vol. of formalin  
 (40%), one drop of phenolphthalein and 2 N  $Na_2CO_3$  to  
 pink coloration; remove any ppt. by filtration without  
 washing; add  $AcOH$  to disappearance of color and finally  
 add a few drops of  $Na_2[Co(NO)_2]$ . A yellow ppt. of  
 $K_2Co(NO)_6$  (insol. in  $AcOH$ ) appears on agitation if  $K$   
 is present. Formalin is not added if  $NH_4$  is absent. A  
 $K$  concn. of 1 in 1000 can be detected. Five references.

*New sensitive reagent for magnesium.* Kh. N. Pochinok and V. Ya. Pochinok (T. V. Shevchenko State Univ., Kiev). *Zhur. Anal. Khim.* 4, 244-7(1949). The new reagent is 3-phenyl-1-*p*-nitrophenyl-3-hydroxytriazine. Directions for prepg. the reagent are given. The compl. is greenish yellow, insol. in H<sub>2</sub>O, sol. in alc., acetone, and toluene, and gives yellow soln. In strong alkali hydroxide solns, a red soln. results. The change yellow to orange to red occurs at pH 11-12. To prep. the reagent for Mg, dissolve 0.05 g. hydroxytriazine in 100 ml. of 90% alc. and add 2-3 ml. of this soln. to 100 ml. of 1% NaOH; the resulting soln. should be cherry-red. The aq. soln. does not keep well, but the alc. soln., kept in the dark, is quite stable. To test for Mg add 1-2 ml. of the reagent to 1 ml. of neutral or weakly acid tested soln. A rose, violet, or blue-violet color appears, depending on the quantity of Mg present. If the Mg content is more than 0.05 mg. per 1 ml., a ppt. will form. The detectable min. is 1  $\gamma$  and the limiting concn. is 1:1,000,000. Alkali, alk. earth, and Pb do not interfere. Cations of the 3rd and 4th analytical group which are pptd. by NaOH, and particularly the ones that are colored, do interfere and should be removed with (NH<sub>4</sub>)<sub>2</sub>S or Na<sub>2</sub>CO<sub>3</sub>. The most intense color, stable for 1 hr., is obtained with a reagent contg. Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub> 2, NaOH 0.6 g., H<sub>2</sub>O 100, and 0.05% alc. soln. of hydroxytriazine 3 ml. This reagent is suitable for detg. Mg in a photoelec. colorimeter. one-half ml. of 0.5% gelatin soln. should be added to the test solns. to prevent pptn. M. Hosh

TITLE: Application of the colorimetric method for uninterrupted measurements of photosynthesis and breathing intensity

SOURCE: Ref. zh. Biologiya, Abs. 16G26

REF SOURCE: Tr. 1-y Resp. nauchn. konferentsii fiziologov i bio-khimikov rast. Moldavii, Kishinev, Kartya Moldovenyaske, 1964, 184-195

TOPIC TAGS: colorimetry, photometric analysis, photosynthesis, plant physiology

ABSTRACT: The author proposes a modification of the colorimetric method, based on a determination of differences between the spectral transparency of two bicarbonate solutions, with the pH of the first in a free balance with the CO<sub>2</sub> within the experimental chamber, and the pH of the second solution with that of the CO<sub>2</sub> of the air outside the chamber. A diagram and description of the experimental equipment and of the method used for its calibration are given. For building the equipment, the photolorimeter FEK-57 was used, from which the measuring shutter was removed and the diaphragm filters replaced by interference filters with a maximum 550-555 mμ filtration. Selenium

cells were substituted by Tsv-3 cesiumantimony cells. The feeding of the equipment was done from a 6 v battery and a 70 v anode battery. The measuring of corrections for the equipment zero was done every 30-60 minutes. A description is given of the mixer for air with the buffer, consisting of two communicating sections, where the air is sucked through the solution at a 0.3-1.0 per minute. Because of large discharges, the glass mixers distort the results and therefore are useless for this work. It is recommended to use a pH 7.4 bicarbonate solution and a 0.1% phenolred indicator. Ye. Yurina

The synergistic action of gallic acid with penicillin. T. S. S. Dyachenko and P. Ya. Pochinok (Ukr. Inst. Epidemiol. and Microbiol., Kiev). *Mikrobiol. Zhur., Akad. Nauk Ukr. R.S.R.* 16, No. 2, 47-53 (1954) (Russian summary).—It was pointed out in a previous communication that in the presence of gallic acid or its salts at neutral or slightly alk. pH, the antibacterial activity of penicillin is enhanced, and that Na gallate has a stabilizing effect upon penicillin subjected to boiling. The antibacterial properties of gallic acid and its salts depend to a considerable extent upon the pH of the medium and the number of bacterial cells in suspension, factors which also influence its synergism with penicillin. Taking these two factors into consideration, studies were conducted with aerobic bacteria. Conditions which favorably influence the antibacterial properties of gallic acid and its salts (pH 7.1-8.2, a minimal suspension of bacterial cells, the properly balanced concns. of the antibacterial agents) also lead to a max. synergistic antibacterial action. Na gallate effectively arrests the growth of *Micrococcus pyogenes* var. *aureus*, and var. *albus*, streptococci, *Proteus vulgaris*, *Pseudomonas aeruginosa*, *Corynebacterium bovis* and others. Antibacterial synergism between gallic acid or its salts and penicillin is best expressed in relation to microorganisms naturally susceptible to the antibacterial action of the two drugs. Na gallate added to H<sub>2</sub>O soln. of penicillin prevents the decompn. of the latter for about 7 days at room temp. and at 37-39°. R. S. Levine

7353 Report on a New Sensitive Manganese Reaction.  
(In Russian.) Kh. N. Pochinok and V. L. Pochinok. *Zhurnal  
Analyticheskoi Khimii*, v. 6, Sept.-Oct. 1957, pp. 238-246.  
An investigation was made of the use of phenyl-1-pyrazol-5-yl-  
3-oxotriazene in determination of Mg in plant ash and natural  
waters. Procedures are described, chemical reaction data are  
tabulated and charted.

Lab. Org. Chem. 10

**Synthesis of triazeno alcohols.** V. Ya. Pochinok (Kiev State Univ., U.S.S.R.). *J. Gen. Chem. (U.S.S.R.)* 16, 1300-10(1940).—To PhMgBr in ether there was added 0.5 mol. MeCOCH<sub>2</sub>N<sub>3</sub> with cooling, after which the mixt. was allowed to stand overnight and then treated with aq. NH<sub>4</sub>Cl and NH<sub>4</sub>OH; the org. layer gave, on evapn. of Et<sub>2</sub>O, an average of 40% of a colorless solid, m. 101-3° (from ligroin), which was unstable and could be preserved only in an atm. of NH<sub>3</sub> or dry H<sub>2</sub>. Analytical data indicate that the product might be *3-phenyl-1-(3-phenyltriazeno)-2-propanol*, thus showing that both the carbonyl and the azide groups reacted with the Grignard reagent. The product yields a *Ag deriv.*, decomp. 142-5° (from C.H.). on treatment with alc. NH<sub>3</sub>-AgNO<sub>3</sub>. Similarly, the use of PhCOCH<sub>2</sub>N<sub>3</sub> in the above reaction gave about 50% *1,1-diphenyl-2-(3-phenyltriazeno)ethanol*, Ph<sub>2</sub>C(OH)CH<sub>2</sub>N<sub>3</sub>: NNHPh, m. 116-18° (from petr. ether-C.H.); *Ag deriv.*, m. 137-44° (from C.H.). G. M. K.

**Synthesis of unsaturated triazenes.** V. Ya. Pochinok (Kiev State Univ., U.S.S.R.). *J. Gen. Chem. (U.S.S.R.)* 16, 1303-5(1940).—CH<sub>2</sub>:CHCH<sub>2</sub>MgBr (from 14.4 g. Mg and 15.5 g. CH<sub>2</sub>:CHCH<sub>2</sub>Br) in 150 cc. Et<sub>2</sub>O was treated with 10.5 g. PhN<sub>3</sub> in 10 cc. Et<sub>2</sub>O, allowed to stand overnight, and decompd. with aq. NH<sub>4</sub>Cl and NH<sub>4</sub>OH to yield 100% crude *allylphenyltriazene* as a red oil which could not be purified by steam distn. Treatment with ammoniacal AgNO<sub>3</sub> in EtOH gave 50% *Ag deriv.*, decomp. 126-8° (from Me<sub>2</sub>CO). This was shaken in Et<sub>2</sub>O with aq. Na<sub>2</sub>S, and evapn. of the org. layer gave *allylphenyltriazene* as a pale oil with a characteristic odor; it rapidly darkens on standing. It is believed that the product was a true triazene of structure PhN:NNHCH<sub>2</sub>CH:CH<sub>2</sub>. G. M. Kosolapoff

The comp. is greenish yellow, insol. in H<sub>2</sub>O, sol. in alc., acetone, and toluene, and gives yellow soln. In strong alkali hydroxide solns. a red soln. results. The change yellow to orange to red occurs at pH 11-12. To prep. the reagent for Mg, dissolve 0.05 g. hydroxytriazine in 100 ml. of 90% alc. and add 2-3 ml. of this soln. to 100 ml. of 1% NaOH; the resulting soln. should be cherry-red. The aq. soln. does not keep well, but the alc. soln., kept in the dark, is quite stable. To test for Mg add 1-2 ml. of the reagent to 1 ml. of neutral or weakly acid tested soln. A rose, violet, or blue-violet color appears, depending on the quantity of Mg present. If the Mg content is more than 0.05 mg. per 1 ml., a ppt. will form. The detectable min. is 1  $\gamma$  and the limiting concn. is 1:1,000,000. Alkali, alk. earth, and Pb do not interfere. Cations of the 3rd and 4th analytical group which are pptd. by NaOH, and particularly the ones that are colored, do interfere and should be removed with (NH<sub>4</sub>)<sub>2</sub>S or Na<sub>2</sub>CO<sub>3</sub>. The most intense color, stable for 1 hr., is obtained with a reagent contg. Na<sub>2</sub>B<sub>2</sub>O<sub>7</sub> 2, NaOH 0.6 g., H<sub>2</sub>O 100, and 0.05% alc. soln. of hydroxytriazine 3 ml. This reagent is suitable for detg. Mg in a photoelec. colorimeter. one-half ml. of 0.5% gelatin soln. should be added to the test solns. to prevent pptn.

Organic Chemistry

Synthesis of sulfido alcohols. V. Ya. Pochinok and  
E. K. Grzhegovskaya (State University, Moscow, U.S.S.R.).  
*Zh. Fiz. Khim.* 15, 307-10 (1949).—(BzCH<sub>2</sub>)<sub>2</sub>S with RMgX  
yields [PhCR(OH)CH<sub>2</sub>]<sub>2</sub>S. Thus, to PhMgBr from 24 g.  
PhBr was added 17 g. (BzCH<sub>2</sub>)<sub>2</sub>S in C<sub>6</sub>H<sub>6</sub>, and the resulting  
red soln. treated with ice and 0.1N HCl, yielding on evapn.  
of the org. layer 33.6% [PhC(OH)CH<sub>2</sub>]<sub>2</sub>S, m. 106-8° (from  
EtOH). No cryst. derivs. could be prepd. with PhNCO,  
AcCl, or BzCl. Similarly 1-C<sub>6</sub>H<sub>5</sub>MgBr gave 1-C<sub>6</sub>H<sub>5</sub>CPh-  
(OH)CH<sub>2</sub>]<sub>2</sub>S, 51%, m. 78-80° (from ligroine). EtMgBr  
gave an uncrystallizable and undistillable oil. G. M. K.

POCHINOK, V. Ya.

CA

New sensitive reagent for magnesium. Kh. N. Puchinok and V. Ya. Puchinok (T. G. Shevchenko State Univ., Kiev). *Zhur. Anal. Khim.* 6, 293-96 (1951); cf. C.A. 44, 2402r. — Improvements in the prepn. of the reagent are described. Detn. of Mg in plant ashes and in natural waters is described. Place in a porcelain crucible enough plant material to contain 0.5-5 mg. of MgO and ignite in a muffle at 500-600°. Cool, add 1 ml. H<sub>2</sub>O, 5 drops of 1:1 KNO<sub>3</sub>, and evap. to dryness. Moisten residue with 1 drop of HNO<sub>3</sub>, add 10 ml. H<sub>2</sub>O, heat, add 0.2 g. of PbO and 3 drops of 0.1 N KMnO<sub>4</sub>, and heat for 1-2 min. This acid. ppt. the interfering PO<sub>4</sub><sup>3-</sup> and Mn<sup>2+</sup> as well as Fe<sup>3+</sup>. Add 2 ml. of 10% Na<sub>2</sub>SO<sub>4</sub> soln. and a pinch of CaSO<sub>4</sub>·2H<sub>2</sub>O, and boil for 2 min. to ppt. dissolved Pb and the excess Ca. Filter through an ashless filter into a 25-ml. volumetric flask, wash ppt. with a satd. gypsum soln., and shake. Transfer 5 ml. into a dry test tube, add 0.5 ml. of 0.5% gelatin soln., mix, add 5 ml. of an alk. soln. of the reagent, mix thoroughly, and after 40 min. compare color intensity with sample and after 40 min. compare color intensity with sample and after 40 min. compare color intensity with sample and prepd. from std. CaSO<sub>4</sub>·2H<sub>2</sub>O soln. 5, gelatin 0.5, and reagent 5 ml. Use a green filter. Det. Mg content from a standard curve. To det. Mg in water add to 100 ml. of sample 1 drop of methyl orange and titrate with 1:9 H<sub>2</sub>SO<sub>4</sub>. This is to neutralize interfering HCO<sub>3</sub><sup>-</sup>. Add 0.2-0.3 g. of CaSO<sub>4</sub>·2H<sub>2</sub>O, bring to a boil, cool, transfer to a 100-ml. volumetric flask avoiding the transfer of the ppt., bring to vol. and allow to settle out. Transfer 5 ml. into a dry test tube, add 0.5 ml. of gelatin, and 5 ml. of reagent contg. NaK tartrate, and finish as before. In plant material contg. 0.14-1.86% of MgO the error of this method was 0.02 ± 0.01% compared to the gravimetric detn. and in water contg. 20.4-136% MgO detd. gravimetrically the error was -0.4 to +1.0%.

Benzothiazoletriazoles, V. Ya. Pochinok, S. D. Zaitseva, and R. G. Brgon (Kiev State Univ.), *Ukrain. Khim. Zhurn.* 17, 595-10 (1961) (in Russian). Shaking 10 g. 2-chlorobenzothiazole with 5 g. Na<sub>2</sub>S in 20 ml. H<sub>2</sub>O and 0.5 ml. AcOH 7 days gave 90% benzothiazoletriazole (5-phenyl-1,3,4-benzothiazole) m. 110-115° (from EtOH), also formed in 48% yield from 0 g. 2-aminobenzothiazole in 30 ml. AcOH treated at 5° with 3.12 g. NaNC<sub>3</sub> in 55 ml. concd. H<sub>2</sub>SO<sub>4</sub>, and the mixt. kept 0.5 hr. at room temp., poured on ice, and treated with aq. urea until N evolution ceased, and then with 3.5 g. NaN<sub>3</sub> in 10 ml. H<sub>2</sub>O. PhMgBr soln. with

1.5 g. I in dry MePh in Et<sub>2</sub>O gave a yellow ppt. and red soln.; the last treated after 0.5 hr. on a steam bath with aq. NH<sub>4</sub>Cl (10 ml) yielded 80% 1-phenyl-3-(benzothiazol-2-yl)triazene (II), decomp. 172-5° (decolor.). (From MePh); heated briefly with concentrated AcOH in EtOH, it gave 10% color. prodn. *Ag salt*, decomp. 250-1°. Boiled with aq. HCl, it yielded 10% 2-aminobenzothiazole and PhOH. Similar treatment of 2-aminobenzothiazole gave 47% 1-phenyl-3-(benzothiazol-2-yl)triazene (from EtOH), which with PhMgBr gave 1-phenyl-3-(4-methyl-2-benzothiazol-2-yl)triazene, decomp. 165-9° (from EtOH); *Ag salt*, decomp. 250-1°. 2-Amino-6-methoxybenzothiazole similarly yielded 73% 1-phenyl-3-(4-methyl-2-benzothiazol-2-yl)triazene, decomp. 167-4° (from EtOH), which yielded with PhMgBr 88% 1-phenyl-3-(4-methoxy-2-benzothiazol-2-yl)triazene, decomp. 167-10° (from EtOH); *Ag salt*, decomp. 255-0°. 2-Amino-5-naphthothiazole (2 g.) in 30 g. strips H<sub>2</sub>PO<sub>4</sub> was added at -5° to 2 g. Na<sub>2</sub>CO<sub>3</sub> in 10 ml. H<sub>2</sub>SO<sub>4</sub>, and the mixt. treated after 2 hrs. with 1.5 g. NaN<sub>3</sub> in 10 ml. H<sub>2</sub>O, yielding 100% α-naphthothiazoletriazole, m. 111-15° (from EtOH). This with PhMgBr gave 70% 1-phenyl-3-(α-naphthothiazol-2-yl)triazene, decomp. 182-5°; *Ag salt*, decomp. above 200°. C. M. Kosolapoff

Triazene alcohols from *p*-azidonacetophenone.  
 Pochinok and E. S. Kakshnikova (Kiev State Univ.).  
~~*Dokl. Akad. Nauk SSSR*~~ *Zhur.* 17, 517-20 (1955) (in Russian). — *p*-  
 $\text{H}_2\text{NC}_6\text{H}_4\text{COMe}$  (20 g.) in 200 ml. dil.  $\text{H}_2\text{SO}_4$  (1:8) treated  
 at 0° with 10.2 g.  $\text{NaNO}_2$  in 50 ml.  $\text{H}_2\text{O}$ , and the greenish  
 diazo soln. kept 40 min. and treated with cooling with 10 g.  
 $\text{NaN}_3$  in 50 ml.  $\text{H}_2\text{O}$  yielded a ppt. of the desired product,  
 which was purified by distn. with steam, giving 70% *p*-  
 $\text{N}_3\text{C}_6\text{H}_4\text{COMe}$ , m. 43° (from dil.  $\text{EtOH}$ ), b.p. 125-30°.  
 This (5 g.) in  $\text{Et}_2\text{O}$  added slowly to  $\text{PhMgBr}$  soln., yielded  
 at first a brownish solid which was transformed by further  
 reaction into a brown oil, and treatment with aq.  $\text{NH}_4\text{Cl}$ ,  
 $\text{NH}_4\text{OH}$  and evapn. of the  $\text{Et}_2\text{O}$  gave 84% *p*- $\text{PhN}:\text{NNH}-$   
 $\text{C}_6\text{H}_4\text{COPhMeOH}$ , m. 81-2°; alc.  $\text{AgNO}_3$  yields the *Ag* deriv.,  
 m. 177-9° (from  $\text{C}_6\text{H}_6$ ).  $\text{EtMgBr}$  similarly gave an oily  
*p*- $\text{EtN}:\text{NNHC}_6\text{H}_4\text{COMeEtOH}$ ; *Ag* salt, m. 135-40° (from  
 petr. ether- $\text{C}_6\text{H}_6$ ). The latter triazene alc. in crude state  
 treated with cold 10%  $\text{H}_2\text{SO}_4$ , evolved  $\text{N}$  and the residual  
 soln. treated 2-naphthol gave red 1,2-(*p*- $\text{MeEtC(OH)C}_6\text{H}_4\text{N}:$   
 $\text{N})\text{C}_6\text{H}_4\text{OH}$ , m. 99.5-100.5° (from ligroine). Apparently  
 the acid cleavage yielded *p*- $\text{MeEtC(OH)C}_6\text{H}_4\text{NH}_2$ .  
 G. M. Kosolapoff

Pochinok, V. Ya.

Alkylation of benzoic acid and 2-naphthol by alkyl-2-naphthyltriazines. V. Ya. Pochinok and V. A. Portnyagina (T. G. Shevchenko State Univ., Kiev). *Ukrain. Khim. Zhur.* 18, 831-4 (1952) (in Russian).—Reaction of  $\text{RMgX}$  with 2-naphthylazide gave:  $2\text{-C}_{10}\text{H}_7\text{NHN:NMe}$  (I), m. 68.5-7.5°; *Et analog* (II), m. 67-8°; *Pr analog* (III), m. 80.5-1.5°; *Bu analog* (IV), m. 83-4°; *iso-Am analog* (V), m. 69-70°; *allyl analog* (VI), m. 83-4°. Soln. of 5 g. I and 3.3 g.  $\text{BzOH}$  in abs.  $\text{Et}_2\text{O}$  leads to gas evolution and after standing overnight the mixt. yields 81%  $\text{BzOMe}$ . II gave 76%  $\text{BzOEt}$ . III gave 71%  $\text{BzOPr}$ . IV gave 77%  $\text{BzOBu}$ . V gave 70%  $\text{BzOAm-iso}$ . VI gave 68%  $\text{BzO-CH}_2\text{CH}_2\text{CH}_3$ . Mixing 5 g. I and 3.9 g.  $2\text{-C}_{10}\text{H}_7\text{OH}$  in  $\text{C}_6\text{H}_6$  followed by standing overnight and heating on steam bath 1 hr. gave 63%  $2\text{-MeOC}_{10}\text{H}_7$ , b. 272-6°, m. 71-2°; *picrate*, m. 93-4°. II similarly gave 65%  $2\text{-EtOC}_{10}\text{H}_7$ , m. 37-8°; *picrate*, m. 91-5°. III gave 67%  $2\text{-PrOC}_{10}\text{H}_7$ , m. 39-40°; *picrate*, m. 74-5°. V gave 56.8%  $2\text{-iso-AmOC}_{10}\text{H}_7$ , m. 26°; *picrate*, m. 90-1°. G. M. Kosolapoff

U S S R

Azacyanines. II. A. I. Kiprianov, V. Ye. Pochinok, and A. I. Tolmachev (T. G. Shevchenko (State Univ., Kiev): *Ukrain. Khim. Zhur.*, 20, 204 (1954) (in Russian).—Cyanine dyes in which one or several methine groups of a polymethine chain are replaced by N atom(s) are called azacyanines. Azacyanines with three N atoms substituted in the conjugated chain have been obtained by K., *et al.*, *ibid.*, 15, 460 (1959). Azacyanines with three N atoms and one, or two *para*-phenyl groups in the conjugated chain were synthesized from 2-amino-5-benzothiazole (I) and 2-(*p*-aminophenyl)benzothiazole(II) and their quaternary salts. It was demonstrated that the introduction of one phenyl group into the azacyanine displaces the absorption max. 45 m $\mu$  towards the short wave lengths, while introduction of 2 *sym.* phenyl radicals on the other hand leads to displacement toward the long wave lengths by 25-30 m $\mu$ . I, m. 129°, was prepd. according to Drozdov (*C.A.*, 32, 1600) from phenylthiourea by its cyclization. 2-Imino-3-methylbenzothiazoline, m. 123°, was prepd. by methylation of I with CH<sub>3</sub>I (Fischer,

CH  
②

Y

(over)

Handwritten signature or initials

*A. J. Kiperian*

*Ann.* 712, 339(1882); *Angew. Chem.* 36, 3135(1903)).  
 2-*p*-nitrophenyl-*bc*-thiazole(III), m. 231°, was prepd. by  
 adding 1 g. *p*-nitrobenzoyl chloride in 50 ml. benzene to 10  
 g. *p*-aminothiophenol in 30 ml. dry benzene, the ppt. HCl  
 salt of III being converted to free base with HCl, filtered,  
 washed, and dried. The yield was 18 g. or 62% (Bogert  
 and Smith, C.A. 18, 2015). The product was not recrystd.  
 for refection to the amine. II, m. 163, was prepd. in 75%  
 yield from III by Sn + HCl reduction; (cf. B. and S., *loc.*  
*cit.*). 1,3-Bis(2-benzothiazolyl)thiazene, n. 217-50°, was  
 obtained in up to 50% yield by adding 5 g. I, dissolved in  
 25 ml. glacial HOAc at 5°, slowly to nitroxy-sulfonic acid  
 (2.6 g. NaNO<sub>2</sub> in 5 ml. concd. H<sub>2</sub>SO<sub>4</sub>) cooled to 0°, keeping  
 the temp. below 10° and then at room temp. for 30 min.,  
 filtering, and adding the filtrate to a cooled water-salt soln.  
 of 2 g. I and 50 g. cryst. NaOAc, whereupon the yell. ppt.  
 which formed turned brownish upon standing. The mixt.  
 was dil. with 300 ml. H<sub>2</sub>O, the ppt. filtered off, washed  
 with dil. HCl and H<sub>2</sub>O, and dried; yield up to 50%. The  
 crude thiazene could not be completely purified from co-  
 inous impurities, recryst. from glacial HOAc was possible  
 only after a hot wash (80°) with nitrobenzene. 1,3-Bis(2-  
 benzothiazolyl)thiazene is yellow; absorption max. at 440  
 mμ; poorly sol. in alc., ether, benzene, sol. when heated in  
 glacial HOAc; insol. in concd. HCl changing from yellow  
 to red; yellow color in strong H<sub>2</sub>SO<sub>4</sub>, turning red upon dilu-  
 tion with H<sub>2</sub>O, and on further dilu. turning yellow again. HCl  
 salt was prepd. by passing dry HCl through an ether sus-  
 pension, decomp. temp. 195-200°, insol. in benzene and  
 ether, decompd. by H<sub>2</sub>O, absorption max. in MeOH contg.

*a. d. Kerp...*  
HCl at 475 m $\mu$ . 3-(2-Benzothiazolyl)-1-(4-methyl-2-benzothiazolyl)triazene was prepd. in yields up to 60% by diazotizing 5-amino-6-methylbenzothiazole and coupling with I. After thorough washing with benzene and ether and 3 recrystals. from glacial HOAc, it decompd. at 237-46°. Absorption max. in alc. contg. HCl was 480 m $\mu$ . HCl salt m. 187-90°, sol. in alc. with orange-red color turning yellow slowly; red salt color disappeared immediately on contact with H<sub>2</sub>O. II (3.5 g.) was diazotized, added to 3-methyl-2-iminobenzothiazoline-HCl, and then neutralized with NaOH. The pptd. base filtered off and washed with dil. F<sup>+</sup>Cl, H<sub>2</sub>O, alc., and ether, resp., yielded 1.2 g. of crude product (IV) <sup>2/4</sup> which did not crystallize and was used as such. IV was slightly sol. in alc., ether, acetone, and glacial HOAc and sol. in pyridine and dichloroethane. IV (6.5 g.) was heated 20 min. on water bath with 0.25 g. Ni<sub>2</sub>SO<sub>4</sub>. The product of an azacyanine extd. with hot water and pptd. from soln. with sat. KI soln. yielded 0.42 g. (62%) of an azacyanine from HOAc, m. 170° with decompn., insol. in water, poorly sol. in alc. and acetone, sol. in C<sub>6</sub>H<sub>6</sub>N, 440 m $\mu$  absorption max. in alc. *o*-(Ethylamino)phenyl mercaptan was prepd. from 2-mercaptobenzothiazole according to K. and Pazenko (C.A. 44, 3487g). 2-(*p*-Nitrophenyl)benzothiazole-EtCl (V) was prepd. by adding 3.1 g. of *p*-nitrobenzoyl chloride in 10 ml. C<sub>6</sub>H<sub>6</sub> to 2.5 g. of *o*-(ethylamino)phenyl mercaptan in 10 ml. dry C<sub>6</sub>H<sub>6</sub>, followed by heating 30 min.

A.I. Kiprianov

on a water bath. The pptd. quaternary salt was filtered, washed with  $C_2H_5$ , and dried; yield 5.3 g. (96%). A portion of the salt was converted to the iodide, orange needles from alc., m.  $235^\circ$ . 2-(*p*-Amino-phenyl)benzothiazole (VI) was prepd. by refluxing 3.9 g. of V, 0.6 ml. concd. HCl, 100 ml. water, and 13 g. Sn for 4 hrs. and filtering the hot tolu. to yield 2.15 g. of the  $SaCl_2$  salt of VI, orange prisms, m.  $107^\circ$  (from alc.); 2 g. of which, in hot alc. soln., was treated with gaseous HCl and the quaternary salt was removed by filtration to yield 1.15 g. (37%), based on the nitro compound. A portion was converted to the iodide to give yellow needles, m.  $290^\circ$  (from alc.). 2-(*p*-Nacrophensyl)benzothiazole- $E(Cl)_4$  resulted from the condensation of *p*-nitrobenzoyl chloride with *o*-(*o*-thylamino)phenyl mercaptan in dry  $C_2H_5$ . The nitro group was then reduced to the amino group, followed by diazotization and coupling with *N,N*-dimethylaniline to yield azo-styrene absorption max. 474  $m\mu$  (alc.). Coupling of diazotized 2-(*p*-amino-phenyl)benzothiazole (VII) with VIII gave a yellow diazaminic compd. with absorption max. of 420  $m\mu$ . From the latter, so. a. was immediately pptd. with  $NH_3$  a blue-violet azacyanine, sol. in alc. with intense reddish-pink color, absorption max. 510-20  $m\mu$ , unstable in soln., decompd. rapidly by alkalis, discolors in light. Attempts to purify by crystn. and by  $Al_2O_3$  chromatography failed.

TITLE: Synthesis by irradiation of allylamine methacrylic acid copolymers

40  
38  
B

SOURCE: Ukrainskiy khimicheskii zhurnal, v. 31, no. 1, 1965, 89-93

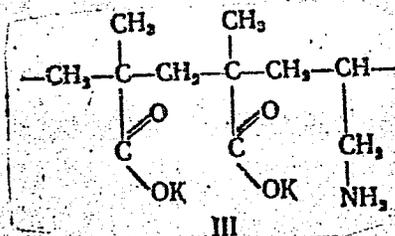

TOPIC TAGS: allylamine, methacrylic acid, copolymer, hydrogen peroxide, benzene  
peroxide, methanol, sodium acetate, IR spectra

ABSTRACT: The synthesizing procedure was tested in producing polyampholites by  
copolymerization of allylamine and methacrylic acid under irradiation by Co<sup>60</sup> gamma  
rays with different solvents, varying the pH of media, temperatures, and initiators.  
The latter were: hydrogen peroxide, benzene, tertiary butyl, persulfates, and  
dinitrile of azo-isobutyric acid. Mixtures of aqueous allylamine and potassium  
methacrylate yielded no copolymers on heating and on usual initiation. Copolymers  
did appear after irradiation and could be precipitated with methanol or sodium  
acetate. They were soluble in acids and alkali. The elementary link of these  
copolymers corresponds to the formula

Card 1/2
