SYNTHESIS OF UREA FROM AMMONIA AND CARBOXYLIC ACID IN PRESENCE OF EXCESS OF AMMONIA. I. B. A. Boletov, A. N. Popova, and J. K. Sokleva. II. B. A. Boletov, V. P. Leman, and A. N. Popova (J. Chem. Ind. Russ., 1937, 14, 631-636, 707-710).

I. The yield of urea in the system $\text{NH}_3\text{-CO}_2\text{-H}_2$, with a 100% excess of NH_3 , over that required for the reaction $2\text{NH}_3 + \text{CO}_2 + \text{H}_2 \rightarrow \text{CO}(\text{NH}_2)_2 + \text{H}_2\text{O}$, rises linearly with time at $135\text{-145}^\circ/80\text{-100 atm}$, whilst at 155-175° it rises rapidly during the first 2-2.5 hr., and then slowly approaches equilibrium during 6 hr. (40% yield of urea). The reaction product contains urea 31-35%, salts 27-30, free NH_3 27, and H_2O 9-11%. V.p. data are recorded for the interval -30° to 65° for the products obtained at 155-175° , and for their eq. solutions.

II. The above process is realised on a semi-industrial scale.

POPOVA, A.N.

Alcoholysis of esters. II. S. I. Lezhuk and A. N.
Popova. *Org. Chem. Ind.* (U.S.S.R.) 5, 628 (1949).
J.C. A. 31, 4972. — The alcoholysis of 93% pure bornyl acetate (I) with 2 vols. of BuOH and 5% of concd. HCl at 80–100° by the method described in the earlier paper is completed in 1 hr. to yield 74.6% bornyl as compared with 63% bornyl obtained from I derived from Siberian pine-needle oil. The reaction in the presence of 2–40% KOH as the catalyst proceeds with considerable saponification and a max. of 12% bornyl. AcOMe (a by-product in the synthesis of AcOH from water gas when autoclaved with 2 vols. of BuOH and 5% HCl at 100° for 5 hrs.) afforded 35.8% AcOBu. In the presence of 0.2–10% KOH and conditions analogous to the preceding expt. the AcOBu yield rises from 14.3 to 51.5%. At higher KOH concn. the ester yield decreases (to 32.3% with 20% KOH) and the reaction is accompanied by excessive saponification (Chas. Blanc).

AUTHORS: Sviridenko, F.F. and Popova, A.N.

TITLE: Production of Open-hearth Phosphate Slags at the "Azovstal'" Works (Proizvodstvo martenovskikh fosfat-shlakov na zavode "Azovstal'")

PERIODICAL: Metallurg, 1958, nr 8, pp 20 - 22 (USSR)

ABSTRACT: The authors describe phosphate slag-making and crushing experience at the "Azovstal'" Works, where a 340 000-ton-a-year slag crushing plant (figure) was commissioned in 1955, slag fertiliser production being organised at the same time. They outline the influence of concentrations of acid and basic oxides in slag on its P_2O_5 content and the phosphate solubility. The latter is determined after sieving through a 0.175 mm aperture screen by a method developed by the Ukrainskiy institut metallov (Ukrainian Institute of Metals) jointly with the works. The complete installation is maintained under a small suction and is provided with air cleaning filters. Data on the amounts of slag produced, its P_2O_5 content and its solubility for various stages of the steel-melting process are tabulated for a heat in which ore with 7% SiO_2 and pig iron with 0.4% Si were used. The data show that production of slag

card1/2

SOV/130-58-8-8/18
Production of Open-hearth Phosphate Slags at the "Azovstal'" Works

with over 10% P_2O_5 amounted to 16.9% of the steel melted.

Actual production is considerably less than that calculated after allowing for scrap. The 1956 and 1957 figures for phosphate slag wool were 8.8 and 9.4%, respectively, of steel weight, the corresponding solubility figures being 12.97 and 11.85. The authors list some reasons for these differences. There are 1 figure and 1 table.

TITLE: The Influence of an Increased Arsenic Content on the Ductility of Rail Steel (Vliyaniye povyshennogo soderzhaniya mysh'yaka na kopravuju vyazkost' rel'sovoy stali)

PERIODICAL: Stal', 1958, Nr 8, pp 739 - 741 (USSR)

ABSTRACT: As the steel manufactured on the "Azovstal'" Works contains up to 0.15% of As, in order to establish the influence of a higher arsenic content on the properties of rails, special rails containing from 0.18 to 0.30% of arsenic were made. Alloying with arsenic was done with arsenic-iron briquettes added to ingot moulds. The composition of steel: C 0.67-0.82, Mn 0.68-0.97, Si 0.16-0.25, S 0.013-0.032, P 0.020-0.038%. All experimental ingots were rolled into rails by the usual technology without encountering any difficulties. The distribution of As content along the length of rails - Table 1; the As content in the rails from top and bottom part of ingots - Table 2; mechanical properties of rails with an increased (A) and normal (B) arsenic content - Tables 3, 4 and 5. It is concluded that an increase of arsenic content from 0.13 to 0.25% has no practical

TITLE: Use of indopan in the psychiatric clinic

B

SOURCE: Zhurnal nevzopatologii i psichiatrii, v. 64, no. 5, 1964, 768-770

TOPIC TAGS: psychiatry, drug treatment, nervous system drug

Abstract: Indopan, the chlorhydrate of alpha-methyltryptamine, has been synthesized in the All-Union Scientific Research Institute of Pharmaceutical Chemistry by N. N. Suvorov and M. N. Preobrazhenskaya. The preparation was found to be a new active agent, chiefly stimulating in effect. The authors used indopan in treating 63 patients (41 men and 22 women), of whom 43 were in the ward and 20 in the dispensary. Based on indications of the stimulating action of indopan, the authors used it to treat patients in whom conditions of sluggishness, apathy, adynamia, reduced mental productivity, and also depressions determining the condition of the patients or accompanied by other disturbances were noted in the clinical picture. Accordingly, patients were divided into three principal groups: the largest group (27 persons) represent patients with a pronounced condition of lassitude, reduced psychic productivity, and also depression. In this group 22

Card 1/3

L 36508-65

ACCESSION NR: AP5010012

O

suffered from a simple form of schizophrenia, and five with prolonged paranoid schizophrenia were in a state of remission. The second group consisted of 16 patients with paranoid schizophrenia, progressing sluggishly, with affective fluctuations. In nine patients depression predominated with increased fatigability, irritability, and also distrustfulness and suspicion. The group of patients with predominance of specifically affective disturbances numbered 20 (6 with circular schizophrenia, 3 suffering from psychothymia, 2 -- depressive-paranoid schizophrenia, 2 -- psychopathy, 3 -- organic disturbances of the central nervous system of varied genesis with predominance of lassitude and asthenia, 2 -- reactive depressions, and 2 -- depressions resulting from aminazine treatment). Indopan was used in tablet form; the authors began with 2.5-5 milligrams, with gradual increase of dosage to 15-20 milligrams, and in some cases, up to 40 milligrams. The dosage depends on the condition of the patients and their sensitivity to the preparation, which was shown by the rapidity of changes in condition. In those cases when the clinical picture was determined by a complex syndrome (depression with delirium, senesthopathies, etc.), indopan was prescribed in combination with stelazine, aminazine, and other neuroleptics. In the first group of patients, the preparation had a chiefly tonic effect. In the second group, indopan treatment resulted in an improvement of the patient's condition: reduction of tension,

Card 2/3

L 36508-65

ACCESSION NR: AP5010012

greater confidence, activity, and working capacity. In patients of the third group, depressive syndromes underwent a reversed development. This occurred in the same order as in the treatment with other antidepressants: initially the motor inhibition was ameliorated, and then the psychic and later the depressive effect disappeared. The following complications were observed in the course of therapy: during the first stage, a sense of excitability, unpleasant sensations in the body, shivering, trembling (2), tachycardia, increased arterial pressure, pains near the heart (1), dizziness, fainting (3), and dermatitis (1). Also noted was intensified irritability, disturbance of sleep (2), and euphoria with lightheadedness. All these effects proved reversible. No toxic effect of indopan (disturbances of functions of the liver, kidneys, and hemopoietic organs) was observed.

TITLE: Use of o-nitrobenzoic acid for quantitative determination of zirconium and hafnium

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 1, 1966, 46-52

TOPIC TAGS: hafnium, zirconium, quantitative analysis

ABSTRACT: The starting solutions of zirconium were prepared from zirconium chloride twice recrystallized from hydrochloric acid. The hafnium solutions were prepared from "experimental" grade hafnium hydroxide which was then dissolved in concentrated hydrochloric acid. In the precipitation of zirconium or hafnium the procedure was as follows. To a determined volume of a standard solution of zirconium or hafnium salt there was added a corresponding amount of concentrated hydrochloric acid to create the required acidity, and the solution was heated to the start of boiling. For each 100 ml of the final solution there was added about 5 grams of ammonium nitrate or chloride. Then,

UDC: 543.70

Card 1/2

L 36081-66

ACC NR: AP6016300

a hot 1.5% solution of o-nitrobenzoic acid was added with constant stirring. The precipitate was filtered and calcined to constant weight in a muffle furnace. The experimental results are presented in a series of figures and tables. It is shown that, for selectivity and sensitivity, o-nitrobenzoic acid is not inferior to m-nitrobenzoic acid, and that it has the advantage of a greater solubility in water and a higher ionization constant. The composition of the zirconium and hafnium o-nitrobenzoates precipitated depends on the acidity of the medium. Ti(IV), Ti(III), Sn(IV) and Sn(II) interfere with the precipitation process. In the presence of Th^{4+} , Fe^{3+} , and Cr^{3+} reprecipitation is necessary. Orig. art. has: 3 figures and 6 tables.

TITLE: Ceramic Nozzles for Welding in an Argon Protective Atmosphere

PERIODICAL: Elektrotechnik, 1960, No.4, pp.123-124

TEXT: The specialised works for manufacturing welding machinery and equipment, Mez Vsetin, n.p. závod Brumov nad Vlárou (Mez Vsetin, n.p. Brumov Plant, Vlárou) produces Argon Arc 032 equipment for welding aluminium conductors with up to 6 mm dia., conductors in the form of sections up to 40 mm square or sheets up to 1.5 mm thick. Supplied with the equipment are sets of ceramic nozzles, which are very favourable for welding in spots with difficult access and they have the advantage that accidental contact between the nozzle and the material will not lead to burning away of material, as is the case with copper nozzles. In spite of the numerous advantages, the ceramic nozzles have the disadvantage of being very brittle and they are liable to crack on contact with other material. If reserve nozzles are not readily available, they can be easily produced from fuse cartridges by machining with carbide or diamond tipped tools. This also enables easy manufacture of

✓

Card 1/3

89303

Ceramic Nozzles for Welding

Z/018/60/000/004/003/003
EO73/E535

nozzles of special shapes, which would be difficult to obtain from the manufacturers. The ceramic is machined at low speeds using paraffin as a coolant, otherwise there is a danger that the ceramic will split. The advantage of fuse cartridges for this application is that they have a hole of approximately the right size, which would be difficult to produce in a workshop. Fig.1 shows a nozzle which is a combination of copper and ceramics, the ceramic being a tube from resistance formers. This combination can be easily manufactured and replaced but it has the disadvantage that the metal part is electrically conducting and the walls of the tube are very thin and brittle. For more exacting work it is favourable to have a fully insulated nozzle with a thicker wall, as shown in Fig.2. In most cases such nozzles have to be made from a combination of several types of fuse cartridges by cementing with waterglass which dries very rapidly. By this method a number of serviceable ceramic nozzles have been produced which proved fully satisfactory in operation over a long period, even for difficult operations as, for instance, welding inside vessels etc. Ceramic nozzles are very promising and it will be advantageous for welders to get acquainted with these as soon as possible. There are 2 figures.

TITLE: Certain peculiarities in the growth of single
crystals of potassium niobate and tantalate
PERIODICAL: Kristallografiya, v.7, no.2, 1962, 300-304
TEXT: The systems $K_2O - Nb_2O_5$ and $K_2O - Ta_2O_5$ have been
studied by differential thermal analysis. The conditions for the
growth of single crystals of $KNbO_3$ and $KTaO_3$ have been worked out
using methods of growth from various melts. Dielectric and
piezoelectric properties of $KNbO_3$ have been measured; in
particular dielectric constant, the piezoelectric modulus d_{33}
and the conductivity. In growing crystals it was found that
initial overheating of the melt destroyed nuclei and led to later
supercooling. There was thus some difficulty in obtaining
homogeneous melts. This could be overcome by seeding followed
by prolonged heat treatment (several days at constant temperature).
Crystals of $KNbO_3$ up to 1 cm cube were obtained by this method of

TITLE: Virtual electrooptical effect in ammonium dihydrophosphate ($\text{NH}_4\text{H}_2\text{PO}_4$)

SOURCE: Kristallografiya, v. 10, no. 3, 1965, 425-427

TOPIC TAGS: electrooptical photography, piezoelectric modulus, piezoelectric crystal, elastic modulus

ABSTRACT: The dispersion of the electrooptical constant r_{63}' in $\text{NH}_4\text{H}_2\text{PO}_4$ crystals was determined by the static method. For this purpose the dispersion of the piezoelectrical constant π_{33} was first established. The experimental set-up consisted of a light source, a collimating lens, crossed polaroids with the test plate between them, a lens and the PEU-13 photomultiplier with a recording microammeter. Wavelengths from 4000 to 5700 Å were studied. The error of measurement was ±3%. Samples consisted of crystal bars of 45° Z-cut. The faces perpendicular to the direction of light were carefully polished and loaded. Measurements were carried out using two samples prepared from the same crystal. The elastic modulus C_{33} for sample 1 was measured to be 8% greater than that for sample 2. As expected, the

Card 1/2

L 58374-65
ACCESSION NR: AP5013725

elastic properties of the sample had a substantial effect on the magnitude of the piezooptical constant. The value obtained for the electrooptical constant of the virtual electrooptical effect is lower than that obtained by the dynamic method. For a wave length of 5560 Å it coincides with the value obtained by West. "The authors thank V. A. Shamburov for his advice on the experimental set-up and reviewing the results and I. S. Raz for reviewing the results."

TITLE: Boris Petrovich Terent'yev (On Occasion of His Sixtieth Birthday)

PERIODICAL: Radiotekhnika, 1960, Vol 15, Nr 3, p 80 (USSR)

ABSTRACT: This article is a short biography of Boris Petrovich Terent'yev, a Soviet engineer, Doctor of Technical Sciences, and a professor at the Moscow Electrotechnical Institute (Moscovskiy Elektrotekhnicheskiy Insitute), written on occasion of his sixtieth birthday, and also commemorating the thirty-fifth anniversary of his engineering and educational career.

✓ 5099. DETERMINATION OF CHLORIDES AND THIOCYANATES IN COAL TAR. 7
Fainzil'd, L.G. and Popova, I.S. (Koks i Khim. (Coke & Chem., Moscow), 1957, (2), 47, 48; 58c). In Russ. Abstr., 1957, vol. 51, 10031).
The volumetric method (cf. Holleman and Sandell, Textbook of Quantitative Inorganic Analysis, 1952, p. 18) for determining chlorides, widely used in Russia in water analysis, is in treatment with a standard solution of mercurous nitrate to form silver chloride precipitate associated with mercuric chloride with the use of sodium nitroprusside as indicator (cf. Moshkov, 1957, 46, 47) for determination in coal tars. Transfer a 10 g sample (heated to 70°) into a 700 c.c. Ehreneyer fitted with a condenser and add 300 c.c. distilled water and 1 g caustic soda to eliminate ammonium salts. Boil for 30 min, cool the flask under running water, and filter. If cloudiness persists repeat the filtration with the use of activated carbon. Reject the first 20 c.c. portion, add to the second add 0.2 c.c. concentrated nitric acid and 1 c.c. 1% solution of caustic soda. Titrate with a standard solution of mercurous nitrate (1 c.c. equivalent to 1 mg chlorine) to opalescence owing to the formation of insoluble mercurous nitroprusside. The method is superior to the "T" procedure used in Russian laboratories because of a more complete extraction of chlorides and the greater speed (1.5 hours compared with 10 hours). Thiocyanates can be determined in the same way. (L.)

Popova, A. S.

Handwritten note: The determination of chlorides and chlorcyanates in coal tar. S. G. Faingol'd and A. S. Popova. *Kols i Khim.* 1957, No. 3, 47-8.—The volumetric method (cf. Kotthoff and Sandell, *Textbook of Quantitative Inorganic Analysis*, 1952, p. 548 (C.A. 47, 3190a)) for deterg. chlorides, widely used in Russia in water analysis, by titration with a standard soln. of $HgNO_3$ to form sol. but undissoci. $HgCl_2$ with the use of $Na_2[Fe(CN)_6]NO$ as indicator is modified for deterg. in coal tar. Transfer a 100-g. sample heated to 70° into a 750-cc. Erlenmeyer fitted with a condenser and add 200 cc. distd. water and 1 g. NaOH to eliminate NH_4^+ salts. Boil for 30 min., cool the flask under running water, and filter. If cloudiness persists repeat the filtration with the use of activated C. Reject the first 25-cc. portion, and to the 2nd add 0.2 cc. concd. HNO_3 and 1 cc. of a 10% soln. of $Na_2[Fe(CN)_6]NO$. Titrate with a standard soln. of $HgNO_3$.

... compared with 3.6 mg. Thiocyanates can be determined in the same way. H. J. Olin

TITLE: The determination of chlorides and thiocyanides in coal tar.
(Opredelenie khloridov i rodanidov v kamennougol'noy smole.)

PERIODICAL: "Koks i Khimiya" (Coke and Chemistry),
1957, No. 2, pp. 47 - 48, (U.S.S.R.)

ABSTRACT: The recommended method of determining chloride and thiocyanides in tar (ChMTU 10094-55) was found to give low results. A modification of the method, namely, the preparation of the salts extracts for subsequent titration with $Hg(NO_3)_2$ is proposed. It consists of boiling 100 g of tar with 200 ml of water and 1 g of sodium sulphate for 30 minutes with an air condenser in order to remove ammonium salts. After cooling the aqueous layer is filtered (if necessary through activated carbon) and an aliquot portion (25 ml) titrated after an addition of 0.2 ml of concentrated nitric acid and 1 ml of 10% nitrate. The analysis takes 1 1/2 hours. The comparison of results obtained by both methods is given and this indicates that the old method required 4 subsequent extractions to obtain results near to those by the new method.

TITLE: Turbocooler. Class 17, No. 171006

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 10, 1965, 35

TOPIC TAGS: aircraft air conditioning, air conditioning, aircraft cabin

ABSTRACT: This Author Certificate introduces a turbocooler (see Fig. 1 of the Enclosure) for air-conditioning airtight compartments in an aircraft. The turbine and fan rotors are joined to each other along their outer diameters and rotate on a gas-lubricated bearing. In order to increase the efficiency of the turbocooler at high speeds, the stationary shaft is hollow and has a thrust plate serving simultaneously for the turbine and fan rotors as a thrust bearing to which a lubricating gas is supplied from the turbine inlet nozzle through the hollow shaft. TITLE: A gasostatic bearing of high rotary velocity. Class 47, No. 180021

SOURCE: Izobrateniya, promyshlennyye obraztay, tovarnyye znaki, no. 6, 1966, 108

TOPIC TAGS: gas bearing, bearing stability, vibration damping

ABSTRACT: This Author Certificate presents a gasostatic bearing of high rotary velocity. The bearing contains gas ducts located in two rows at the circumference. To lead away the dirt from the stagnant zone of the working space in the bearing and to increase the resistance of the shaft to vibrations, the internal surface of the bearing contains an axial duct connected by a radial hole to the surface of the bearing (see Fig. 1). The polarly opposite side carries another axial hole connecting both rows of the ducts.

Action of chlorine on chromite in the presence of reducing substances. V. S. JATLUV and A. V. PUNJWA (J. Appl. Chem., Russ., 1933, 6, 1049-1053). The entire mixed oxide content of chromite is converted into Fe, Al, and Cr chlorides by passing Cl₂ during 30 min. at 600°; this treatment cannot be applied to the separation of titaniferous magnetite because of formation of chlorides from the magnetite > from their oxides, for which reason conversion is obtained at lower temp. in presence of C. Admixture of CO to the 1%, retards reaction, owing to dilution of Cl₂. R. T.

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 10, 1962, 14, abstract 10A90 (Geologiya i geofizika, no. 9, 1961, 112-114)

TEXT: The results of paleomagnetic investigation of Lower Carboniferous sedimentary rocks are given. The purpose of the research was to determine the positions of the magnetic poles in this geologic period. Oriented specimens were selected in the vicinity of the Minusinskaya Basin (the overwhelming majority of rock specimens studied was found to be sufficiently stable magnetically). It was established that the average declination and inclination differs considerably from the present geomagnetic field parameters in this area. The coincidence of the data obtained with the results of other authors is noted. [Abstracter's note: Complete translation]

Agri

✓ Fertilization of plants. I. V. Mosolov, A. N. Lapshina, and A. V. Popova. *Zemledelie* 4, No. 5, 121-4 (1959).—Spraying spring wheat with 0.5% soln. of N-P-K (0.1 g. N, P_2O_5 , and K₂O per pot during several applications) during blossoming stage did not increase the yield (in some cases it was decreased), but the protein content of the grain increased. Spraying with P raised the content of reducing sugars in the leaves of wheat and slightly increased the sucrose. With K or N-P-K the synthesis of sucrose increased. Spraying clover in bloom in the field with N-P-K at times increased and at others decreased the yield of seed. Superphosphate spray increased slightly the yield of clover seed. Spraying sugar beets with superphosphate when leaves contain sugars increases the sugar content of the roots. In general, the results are conflicting.

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 7, 1966, pp 645-648

Abstract: [English article] Remote hybridization is one of the effective methods of selection. While much is known about tomatoes resulting from this mode of selection, there is little information in the literature, however, on remote hybridization in eggplants. To produce eggplant varieties which are more resistant to verticilliated fading, of greater economic value, and with a higher percentage of longistyled flowers, the authors crossed numerous varieties of *Sol. melongena* L. with *S. gilo* Raddi. The paper describes the basic characteristics of five new forms obtained. There are 4 Bulgarian and 6 Soviet-block references. (Manuscript received, 22 Mar 66.)

Tabulates and discusses treatment of 16 cases of usually fatal pneumococcic meningitis which resulted in recovery in 11 cases. Treatment involved intramuscular or endolumbar injection of penicillin in combination with sulfamide therapy and blood transfusions. Intramuscular injections required 20,000-30,000 units per day for 31-40 days, endolumbar injections of not less than 20,000-30,000 units per day for 2-3 weeks. Suboccipital injections found quickly effective where endolumbar injections showed no results.

Abstract : Results of the experiments carried out during 1955-1956 at the Institute of Plant Cultivation of the Academy of Sciences of Bulgaria on hybrids heterosis: showing Zarya x Komet, No 10 x Bizon, No 10 x Rudzhers and others. In the hothouse the plants were sprayed with the solutions of 2,4-D and tomafix. The spraying both of the racemes and the entire plant with 2,4-D solution (10 milligrams per liter) increased the fruit setting by 80.8%. Spraying of the racemes with tomafix solution (2 milligrams/liter) - by 70.3% and artificial pollination of the

AUTHOR: Lapp, G. B.; Popova, D. I.

TITLE: Thermoelectric stability of thermocouples made of refractory metals and
alloys

SOURCE: Izmeritel'naya tekhnika, no. 9, 1965, 19-21

TOPIC TAGS: thermocouple, thermoelectromotive force, refractory, metal, tungsten,
molybdenum, temperature measurement

ABSTRACT: Comparative tests were made of tungsten, molybdenum, tungsten-rhenium and
molybdenum-aluminum wires at the Sverdlovsk Affiliate of the All-Union Scientific
Research Institute of Metrology to find the most reliable materials for thermal elec-
trodes and to determine the possible sources of error in temperature measurement.
It was found that tungsten and a tungsten alloy with 20% rhenium are the most stable
materials with respect to thermoelectromotive force. Following these in decreasing
order of stability are tungsten alloys with 10 and 5% rhenium respectively, molybde-
num, and molybdenum alloyed with aluminum. It was also found that a tungsten-molyb-
denum thermocouple is extremely stable. The thermoelectromotive force of this type

Card 1/2

L 3804-66

ACCESSION NR: AP5025581

of thermocouple does not vary more than 50 μ V (~8 deg) after 25 hours annealing in the 1500-1900°C range. The calibration characteristics of the thermocouples may be stabilized by pre-annealing at higher than operating temperatures. Orig. art. has: 3 tables.
