

Automatic graduation of accurate electrical measuring instruments. 110-2-8/22

The combination of graduating machine and stabiliser has increased productivity in the graduation of instruments and reduces the overall error of scale marking to 0.05 - 0.07% of the full-scale deflection of the instrument. The apparatus makes possible mass production of high-accuracy instruments, with graduation carried on on the conveyor belt. There are 3 figures, no literature references.

TITLE: To the Calculation of Photoelectric Fluxmeters

PERIODICAL: Izmeritel'naya Tekhnika, 1959, Nr 5, pp 30-35 (USSR)

ABSTRACT: The authors state that photoelectric fluxmeters can attain a higher sensitivity than any other service, if they work with a galvanometer. Fig.2 gives the structural scheme of this fluxmeter. The setting is: 1) Measuring coil; 2) transformer for the voltage difference; 3) Galvanometer; 4) photoelectric amplifier; 5) stabilizing link; 6) electron amplifier; 7) negative regeneration coupling. The authors analyse the dynamic characteristics of the photoelectric fluxmeter while it is measuring magnetic current. The transmission function is derived from the function with a condition zero. The input influence is regarded as gradual. After deriving the complete transmission function, the parameters are calculated for the measuring of spontaneous magnetic current. The calculation of a numerical example is added. The presented correlations give the possibility of making calculations for a highly sensitive photo-

TITLE:

Universal Direct-Current Percentage Bridges

PERIODICAL:

Izmeritel'naya tekhnika, 1959, Nr 7, pp 35-38 (USSR)

ABSTRACT:

The authors discuss theoretical aspects of a universal direct-current percentage bridge. Based on these considerations, they describe the R-19 percentage bridge designed and manufactured at the plant "Vibrator". The bridge is designed for measuring resistances in the range of 1 ohm to 1 megohm and has 3 measuring ranges of percentage error ± 0.25 ; ± 2.5 and $\pm 25\%$. The graduation value of the indicating instrument is 0.01, 0.1 and 1% accordingly. For routine engineering measurements, when an accuracy of 0.1-0.3% is adequate, an ordinary resistance box, for example, KMS-6, may be used in the comparison arm of the bridge. A somewhat simplified circuit diagram of the bridge is shown in fig.2, while fig.3 shows a photograph of the bridge. The overall dimensions are 410x300x180mm. The weight is 12 kg. The power required from the network does not exceed 50 watts. There are 2 circuit diagrams, 1 photograph and 5 references, 3 of which are Soviet and 2 German.

TITLE: Method of determining the time constant of photosensitive cells. Class 21,
No. 168382

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 4, 1965, 49-50

TOPIC TAGS: photosensitive cell, time constant measurement QM

ABSTRACT: A method of determining the time constant of photosensitive cells by varying their illuminance is proposed. To approximate operating conditions, the cell is inserted in the circuit of a photoelectric compensator operating under self-oscillation conditions. The time constant is either calculated on the basis of the critical conditions of dynamic stability or read from a previously calibrated balancing resistor in the feedback circuit of the compensator. TITLE: Photoelectric amplifier with an electric corrector. Class 21, No. 176975 [announced by "Vibrator" Plant (Zavod "Vibrator")]

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 41

TOPIC TAGS: photoelectric^{cell}, galvanometer, thermoelectromotive force, amplifier design, remote control, ~~current~~, ~~sensitivity~~, ~~electronic circuit~~

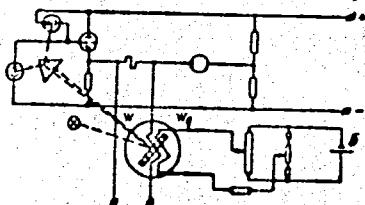

ABSTRACT: 1. The photoelectric amplifier with the electric corrector, consisting of a galvanometer and a photoelectric measuring circuit, is characterized by the fact that the measuring coil of the galvanometer is equipped with additional winding, insulated from the measuring coil and connected to a variable voltage source. The above design is intended for remote correction of the zero and for its even and accurate control. 2. The amplifier, described in section 1, is characterized by the fact that the measuring coil of the galvanometer is equipped with separate current feeders made from material with a low thermoelectromotive force in order to increase the sensitivity of the apparatus.

TITLE: Potentiometer device for checking electrical measuring apparatus with automatic recording of corrections. Class 21, No. 180259

SOURCE: Izobreteniya, promyshlennyye obraztay, tovarnyye znaki, no. 7, 1966, 33-34

TOPIC TAGS: potentiometer, automatic ^{control} equipment

ABSTRACT: This Author Certificate presents a potentiometer device for checking electrical measuring apparatus with automatic recording of corrections. It contains both a potentiometer and a recording device. To increase the checking rate, electro-mechanical control of the printing device is accomplished with a decade potentiometer. The most significant decade of the potentiometer, also serving as the line device, is connected by means of a slave system to the drive roller of the printing device (see Fig. 1). The least significant decade is mechanically coupled with additional contacts engaging the electromagnetic symbol pushrods of the printing device.

TITLE:

On Some Estimations Combined With the Linear Methods for the Approximation of Functions by Algebraic Polynomials (O nekotorykh otsenkah, svyazannykh s lineynymi metodami priblizheniya funktsiy algebraicheskimi mnogochlenami)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Fiziko-matematicheskiye nauki, 1958, Nr 3, pp 104-106 (USSR)

ABSTRACT: Let $f(x) \in K^{(r)}_{H^{(\alpha)}}[-1, 1]$ mean that $f(x)$ is defined on $[-1, 1]$, that it has the r -th derivative and that $f^{(r)}(x)$ on $[-1, 1]$ satisfies the Lipschitz condition (α, K) . Let $\lambda_k^{(n)}$ be a triangular matrix, where $\lambda_k^{(n)} \leq \lambda_{k+1}^{(n)}$, $\Delta \lambda_k^{(n)} \geq 0$, where $\mu_k^{(n)} = \frac{1 - \lambda_k^{(n)}}{k^r}$, $0 < k \leq n$; $r \geq 0$. Let further $U_n(f; x; \lambda) = \frac{c_0}{2} + \sum_{k=1}^{n+1} \lambda_k^{(n)} c_k T_k(x)$, where $\frac{c_0}{2} + \sum_{k=1}^{\infty} c_k T_k(x)$ is the Fourier-Chebyshev series of $f(x)$.

Card 1/2

On Some Estimations Combined With the Linear Methods SOV/155-58-3-20/37
for the Approximation of Functions by Algebraic Polynomials

Theorem: For every α , $0 < \alpha < 1$ and every integral $r \geq 0$ for $n \rightarrow \infty$
it holds:

$$\epsilon_n = \sup_{f(x) \in KW_r^H(\alpha)} |f(x) - U_n(f; x, \lambda)| = \\ = K \frac{2^{r+1}}{\pi^2 n^\alpha} (\sqrt{1-x^2})^{r+\alpha} \int_0^{\pi/2} t^\alpha \sin t dt \left| \sum_{k=1}^n \frac{1-\lambda_k^{(n)}}{k^r(n-k+1)} - \frac{\ln n}{n^r} + O\left(\frac{1}{n^{r+\alpha}}\right) \right|.$$

For $r=0$ there follows a result of I.M.Ganzburg and A.F.Timan.
The author mentions S.M.Nikol'skiy, L.I.Tuchinskiy, and S.G.
Selivanova. The author thanks A.F.Timan for giving the problem
and aid.

TITLE: On the Question of Extremal Functions of Some Problems of the Theory of Approximation (K voprosu ob ekstremal'nykh funktsiyakh v nekotorykh zadachakh teorii priblizheniya)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 121, Nr 6, pp 977-979 (USSR)

ABSTRACT: Let $W_H^{(r)}(\alpha)$ be the class of 2π -periodic functions, the r -th derivative of which satisfies the Lipschitz condition with the power α and the constant 1. Let $\lambda_k^{(n)}$ ($k=0, 1, \dots, n+1$; $\lambda_0^{(n)} = 1$, $\lambda_{n+1}^{(n)} = 0$) be a triangular matrix of numbers and let $M_k^{(n)} \leq M_{k+1}^{(n)}$. $\Delta^2 M_k^{(n)} \geq 0$, $M_k^{(n)} = \frac{1 - \lambda_k^{(n)}}{k^2}$. To every $f(x) \in W_H^{(r)}(\alpha)$ there corresponds a sequence of trigonometric polynomials.

$$U_n(f; x; \lambda) = \frac{a_0}{2} + \sum_{k=1}^n \lambda_k^{(n)} (a_k \cos kx + b_k \sin kx),$$

where a_k , b_k are the Fourier coefficients of $f(x)$.

Theorem: For every value $x_0 \in [-\pi, \pi]$ there exists an $f_0(x) \in W_H^{(r)}(\alpha)$ ($0 \leq \alpha < 1$, $r \geq 0$ integral), for which

Card 1/2

On the Question of Extremal Functions of Some Problems
of the Theory of Approximation SOV/20-121-6-6/45

$$|f_0(x_0) - U_{n_i}(f_0; x_0; \lambda)| > \frac{2^{\alpha+1}}{\pi^2 n_1^\alpha} \int_0^{\pi/2} t^\alpha \sin t dt \cdot \left| \sum_{k=1}^{n_i} \frac{M_k^{(n_i)}}{n_i^{k+1}} - \frac{\ln n_i}{n_i^r} \right|$$

Here n_i ($i=1, 2, \dots$) is a certain increasing sequence of natural numbers and $\sum_{n_i} \rightarrow 0$ for $i \rightarrow \infty$.

Theorem: In order that the linear method of approximation $U_n(f; x; \lambda)$ for $n \rightarrow \infty$ yields an approximation for every $f(x) \in W^{(r)} H^{(\alpha)}$ having the same order as the best approximation it is necessary that

$$\sum_{k=1}^n \frac{M_k^{(n)}}{n^{k+1}} = \frac{\ln n}{n^r} + O\left(\frac{1}{n^r}\right).$$

There are 3 Soviet references.

TITLE: E. A. Man'kin, on his 60th birthday

SOURCE: Elektrichestvo, no. 11, 1965, 86-87

TOPIC TAGS: electric engineering personnel, synchrotron

ABSTRACT: Emmanuil Abramovich MAN'KIN, who after 35 years of scientific-engineering work ranks as one of the senior workers in the transformer-building field, was 60 years old on 28 May 1965. After graduating in 1927 from the electrical machine building institute in Moscow he became an engineer of the Moscow transformer factory (presently Moskovskiy elektrozavod; Moscow Electric Factory). He constructed and headed until 1934 the transformer testing station. During the 1935-1942 period he was head of the bureau for the design of special transformers, and during these years carried out numerous theoretical investigations concerning electromagnetic transformer calculations. His methods for the calculation of transformer leakage earned

UDC: 621.314.21

Card 1/2

L 22432-66

ACC NR: AP6013618

him the degree of candidate of engineering sciences. Between 1942 and 1947 he was deputy head of the engineering department of the factory, and since 1947, while heading the Bureau of Electro-magnetic Design of the Spetsial'nyy konstruktorskiy byuro (Special Construction Bureau) he has been one of the main designers of the world's first 280 MeV synchrotron. From 1955 to 1958 E. A. MAN'KIN headed the group of designers working on the 400 kV transformer equipment of the Volgograd-Donbass power line. Since 1960 he has been head of the transformer laboratory of the Vsesoyuznyy elektrotekhnicheskiy institut (All-Union Electrotechnical Institute) in Lenin. In the same year he obtained the degree of Doctor of Engineering Sciences for his works "Electromagnetic design of transformers, reactors, and charged particle accelerators." In the course of his engineering and research activity he published more than 30 papers. Orig. art. has: 1 figure. [JPRS]

TITLE: Approximation of functions given on a finite segment or on a system of segments by trigonometric polynomials

SOURCE: IVUZ. Matematika, no. 1, 1966, 115-123

TOPIC TAGS: approximation, approximation method, difference equation, difference method, trigonometric approximation

ABSTRACT: It is shown that, in the case of approximating a function given on a finite segment or on a system of nonintersecting segments, theorems analogous to those occurring in the case of approximation by algebraic polynomials also hold true for approximation by trigonometric polynomials. Four theorems and 5 lemmas are stated and demonstrated in proof of this assertion. Fundamental to the statement of the analog problem for the approximation by trigonometric polynomials is the concept of the modulus of smoothness, defined as follows. Let $f(x)$ be a function bounded on the set $K = \bigcup [a_j, b_j]$, and the segment $I \subset K$. The r^{th} local modulus of smoothness of $f(x)$ is denoted by $\omega_r(f; I)$, that is $\omega_r(f; I) = \sup_{\substack{x \in I \\ x+h \in I}} |\Delta_h^r f(x)|$, where $\Delta_h^r f(x)$ is the r^{th}

Card 1/2

UDC: 517.512

L 40064-66

ACC NR: AP6017270

difference of the function $f(x)$ with step h . Then the r^{th} modulus of smoothness is equal to $\omega_r(f; h) = \sup \{\omega_r(f; t)\}$, where the upper plane is taken along the entire segment $I \subset K$, the length of which does not exceed rt . The author thanks Yu. A. Brudnyy for his advice and assistance in the drafting of the article. Orig. art. has: 14 equations.

TEXT: For polarographic measurements a special arrangement is proposed, for which two types of instruments : 1) using thermionic tubes, 2) using transistors (with a.c. mains supply for both versions), are developed and manufactured. Indicating instruments with a sensitivity of the order of tens and hundreds of microamps are used for measurements. Basic diagrams of the instruments of both versions are given. The strength of the current in the instruments is controlled by voltages of the order of 10^{-3} - 10^{-6} volts applied across the control electrodes. Technical characteristics of the instruments (dimensions, weight, etc.) are given. The instruments are designed for laboratory and industrial use. There are

TITLE: The structure of the various modification of pyrolytic carbon

SOURCE: Zhurnal strukturnoy khimii, v. 6, no. 1, 1965, 66-69

TOPIC TAGS: pyrolytic carbon structure, interboundary region, mosaic structure, carbon anisotropy, carbon azimuthal disorientation, natural graphite structure, hydrocarbon pyrolysis

ABSTRACT: The structure of pyrolytic carbon was studied by microstructural, electron-microscopic, X-ray and microdiffraction analysis to determine the conditions of structure formation, depending on the temperature, method of heating and atmosphere of the reaction space. Various hydrocarbons (propane, butane, etc.) were used as sources. The deposit was obtained by heating in a high-frequency induction furnace or by an exterior heat source to temperatures above 2000°C; after thermal treatment was carried out at above 3000°C. The presence of interboundary regions of a specific globular structure was

Card 1/2

L 36981-65

ACCESSION NR: AP5007756

detected which determine the structural anisotropy of the pyrolytic carbon. In specimens obtained under nitrogen, the interboundary regions were parallel, occurring at regular intervals. Occasionally, boundary regions showed specific chain-like outgrowths. Thermal treatment of pyrolytic carbon at temperatures above 3000C caused block formations in the recrystallized pyrolytic carbon of a mosaic-like substructure and regions of shifting dislocation; recrystallization led to a considerable decrease in the azimuthal disorientation. The high anisotropy was also seen in the roentgenogram. The carbon obtained at a temperature above 2000C in a vacuum (electric heat source) corresponded to the structure of amorphized natural graphite, with a high degree of preferred crystal orientation (anisotropic factor about 30); the carbon obtained by pyrolysis in the vacuum induction furnace was more ordered than that obtained in a vacuum resistance furnace. Purely scientific interest in the study of PG is derived from its properties which depend only on changes in structure.

Soviet researchers contributed to the study of PG in the following fields:

1. Mechanism of the pyrolysis of hydrocarbons. P. A. Tesner and co-workers advanced the theory of direct high-temperature decomposition

Card 2/5

L 26926-65
ACCESSION NR: AP5006976

is the most credible, but that the multiple dehydrogenation-condensation mechanism coupled with radical polymerization ought also to be considered.

5

studied by G. V. Benevolenskaya and V. F. Dovzhenko.

2. Structure of PG. Recent contributions were made by A. S. Fialkov and co-workers on the x-ray study of the crystal structure, V. I. Kastochkin and A. T. Kaverov on the determination of the degree of graphitization as a function of the $c/2$ spacing (between layers), and A. S. Fialkov and co-workers (Zh. strukt. khimii, v. 6, no. 1, 1965) on x-ray and electron-microscope study of the microstructure of PG.

Card 3/5

L 26926-65
ACCESSION NR: AP5006976

3. Properties of PG. P. A. Tesner and I. M. Timofeyeva determined that the density and properties of deposits were independent of the nature of hydrocarbons and that the hardness of PG depends on temperature of [redacted] and has a maximum in the 1000—1520C range. Other properties

constant — were described solely on the basis of Western sources.

In conclusion, the use of PG as super-heat-resistant construction material, erosion-resistant coatings for rocket parts, moderator in nuclear fuel, and in high-temperature thermocouples and thermoelements is indicated. The only exclusively Soviet-originated application was given as a patent issued for PG-coated graphite tubes for use as highly efficient resistance heaters in electric furnaces.

Ed. A.P. Chikhrayev. Ed. of Publishing House: R.A. Selina: Tech.
Ed.: S.P. Andreyev.

PURPOSE: This collection of articles is intended for technical engineers and scientific personnel in metallurgy and in mechanical engineering. It will also be of interest to designers of rolling equipment.

CONTENTS: This collection of articles treats the theory of rolling.

It discusses such factors as the total and the unit pressures of the work on rolls, moments of rolling, forward slip, spread, etc. It also includes results obtained from investigation of rail quality, rolling of cast iron sheets, and other problems.

No personalities are mentioned. References follow each article.

Chikhrayev, A.P. [Candidate of the UkrSSR]. L.V. Kapustin, and Chikhrayev, A.P. [Candidate]. Experimental investigation of distribution of unit pressures on a Contact Surface in Rolling in Plain Rolls. 5

The investigation was carried out to develop a reliable method of measuring unit pressure on the contact surface and to obtain, by measurement, data on distribution of unit pressure during rolling with various drafts of strips having various initial thicknesses and widths.

Chikhrayev, A.P. and I.M. Klimenko. Experimental Investigation of Distribution of Unit Pressures on the Contact Surface During Rolling in Grooved Rolls. 30

Chikhrayev, A.P. and Rudov, V.S. The Contact Surface, and Pressure on Rolls in Pilger [Rocker] Rolling. 33

The authors present new methods for measuring pressure on rolls in a Pilger mill; for rolling pipe with 219, 273 and 225 mm diameters, and for determining the instant area of contact.

Vatkin, Ye.L. [Candidate of Technical Sciences]. Pressure on Rolls in Rotary Milling of Tubes on a Short Mandrel. 73
The author compares experimental data on the total and unit pressures with the results obtained through using formulas the author derived.

Chikhrayev, A.P., V.M. Klimenko, V.I. Molchanov, M.M. Safyan, V.D. Chikhrayev, and J.N. Rabinovich. Preparation on Rolls in Gliding Mill. 93

The authors describe the methods, instruments, and results of an investigation carried out at the Zaporozhsky Mill on horizontal and vertical rolls at slab rolling.

Sar'yan, M.M. [Candidate of Technical Sciences]. Experimental Investigation on the Law-Arm of Moments in Cold Rolling. 101
The author describes investigation on the above subject, and gives the total pressure on rolls in cold rolling of steel sheets 1, 2, 3, and 5 mm thick at various drafts.

Chikhrayev, A.P., and M.M. San'ko. [Candidate of Technical Sciences]. 127
Forward Slip in Shape Rolling of designated shaped rolls in forward slip. The author describes methods of determining of areas in the contact area in transverse and longitudinal directions, respect to forward slip; the method is based on experiments with right-angled, square, rhombic, oval, and circular grooves.

Rabiny, M.J. [Candidate of Technical Sciences]. Derivation of a

Formula for Spread of Rolling on Plain Rolls. 152

The author presents a method of calculation of spread in rolling.

It is based on theoretical determination of areas in the

contact area in transverse and longitudinal directions.

AUTHORS: Chekmarev, A.P., Klimenko, V.M., Maleshko, V.I., Saf'yan, M.M.,
Chekhanov, V.D., Rabinovich, S.N.

TITLE: Pressure on rolls in rolling on a slab mill

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 6, 1961, 3, abstract 6D13
("Nauchn. tr. Dnepropetr. metallurg. in-t", 1960, no. 39, 93 - 103)

TEXT: The authors describe methods and results of investigating the pressure of metal on horizontal and vertical rolls of a slab mill at the "Zaparozhstal" Plant. The investigation was carried out in 1954. The pressure on the rolls was measured with the aid of dynamometers. The results and data obtained from the rolling of soft-grade and stainless steel slabs show, that the magnitudes of full pressure on the horizontal rolls are relatively uniformly distributed over the passes. Maximum pressure when rolling stainless steel is 1,350 - 1,450 tons, and 900 - 1,400 tons when rolling soft steels. The distribution of pressure over the passes on vertical rolls without resetting them, is non-uniform; pressure is considerably higher in even passes than in odd ones. In rolling

Card 1/2

Pressure on rolls in rolling on a slab mill

S/137/61/000/006/031/092
AOC6/A101

with resetting of vertical rolls, the distribution of pressure over the passes is relatively uniform. Maximum pressure is 300 - 350 tons on soft steels and 700 - 750 tons on stainless steels.

TITLE: Gear-tooth Form Coefficient With Consideration of the Forces of Friction and the Variability of Stresses for Cylindrical Form-corrected Spur Transmissions (Koeffitsiyent formy zuba s uchetom sily treniya i peremennosti napryazheniy dlya tsilindricheskikh pryamozubykh korrigirovannykh peredach)

PERIODICAL: Tr. Mosk. energ. in-ta, 1955, Nr 17, pp 112-121

ABSTRACT: Formulas are derived and gear-tooth form-coefficient η calculating charts for form-corrected transmissions with consideration of the forces of friction for $z > 10$ are presented. The formulas were derived according to the well-known procedure of A. I. Petrusevich, but for the sake of simplification certain additional assumptions were introduced, as follows: 1) The influence of the parameters of the conjugated gear has little effect on the value of η and is not taken into consideration. This results in a discrepancy of less than 5% when the sum of the teeth $z_1 + z_2 = 50$ and less than 3% when $z_1 + z_2 = 100$. 2) For teeth working on both profiles the calculation is

Gear-tooth Form Coefficient With Consideration (cont.)

carried out according to the symmetrical cycle of σ_{-1} in view of the comparatively insignificant stresses in the critical cross-section of the tooth which create a certain asymmetry in the cycle. 3) The critical cross section of the tooth coincides with the dedendum circle when the latter is larger than the base circle and coincides with the base circle in the opposite case; this holds sufficiently true for $z > 10$ for non-undercut teeth. In this way all the possible combinations for η are reduced to four cases, viz., for either the driver or the driven wheel and with teeth working either on one or on both flanks. It has been demonstrated that, everything else being equal, η of the driven wheel is smaller than that of the driver wheel by approximately 20% when working on one flank and by approximately 15% when working on both flanks. For working on one flank the value of η is smaller than for working on both flanks by about 6% in the case of a driver gear and by about 12% for a driven gear. All factors being considered, the safety margin of strength for a steel gear tooth working on both flanks drops 44 - 50% as compared to working on one flank; for cast iron it drops 31 - 35% under similar conditions.

TITLE: A Combined Graphical and Analytical Method for the Design of Structures by the Limit Equilibrium Theory in Bending with Tension (Grafoanaliticheskiy sposob rascheta konstruktsiy po metody predel'nogo ravnovesiya pri izgibe s rast-yazheniyem)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, No.2, pp. 19-22 (USSR)

ABSTRACT: In simultaneous tension and pure bending the limiting equilibrium, when all the fibres of a beam reach either the compressive or the tensile yield stress, is expressed by the Hirkmann formula (Eq.1). It is convenient to define two ratios, namely, that of the limit value of the tension force acting simultaneously with a bending moment to its limit value without the bending moment and the analogous ratio for the limit bending moment acting with or without the tension force. The relation between the two ratios can be computed from the geometry of the section. Solid rectangular and circular sections, thin- and thick-walled circular tubes and the 'I' section are treated. The above relation is shown graphically for each type of section (Fig.6). Eccentric tension modes are represented on this graph by straight lines through the origin. Examples Card1/2 illustrate the use of the graph to determine the limit bending
