AUTHORS: Voronkov, M.G. and Rabkina, S.M.

TITLE: Studies in the field of alkoxy silanes.
XVI. Reaction of tetraalkoxy silanes with ketones

PERIODICAL: Zhurnal obshchey khimii, v. 31, no. 4, 1961, 1259 - 1265

TEXT: In addition of their paper (Ref. 1: ZhOKh., 30, 1955 (1960)), and considering the available methods of synthesizing aldehyde and ketone acetals, the authors of the present paper studied the effect of substituting methyl radicals for the ethoxy groups in tetraethoxy silane on acetalization. For this purpose, acetone and methyl-ethyl ketone were allowed to react with methyl ethoxy silanes of the formula $(CH_3)_nSi(OC_2H_5)_{4-n}$ ($n=1-3$). Substitution of methyl groups for ethoxy groups on the silicon atom considerably reduced the capability of ethoxy silanes to acetalize ketones. The diethyl ketal yield in the reaction of methyl-ethyl ketone with dimethyl diethoxy silane ($n=2$) was quite low, whereas no ketal was formed in the reaction of acetone with trimethyl ethoxy si-

lane. As acetals in general, and ketals in particular, split off alcohol at elevated temperatures, the synthesized acetals were distilled in the presence of Na or its alcoholate, the acetals otherwise being contaminated by alcohol and the corresponding α,β -unsaturated ether. The katal's of cyclohexanone and its derivatives readily split off alcohol during distillation, and are converted to 1-alkoxy cyclohexenes. This ability of 1,1-dialkoxy cyclohexanes easily yields 1-alkoxy cyclohexenes which are formed immediately from cyclohexanone and tetraalkoxy silanes:

Synthesis was performed by simple distillation of a mixture of cyclohexanone and the corresponding tetraalkoxy silane in the presence of H_3PO_4 .

This mixture had previously been boiled for 8-14 hr. Nearly all the alcohol is first distilled off, and immediately afterwards the reaction product containing some alcohol. It was purified by distillation on Na, most suitably at low pressure. Five 1-alkoxy cyclohexenes were synthesized in

Studies in the field of alkoxy ...

this way with yields between 55 and 70% (Table). The presence of a certain quantity of alcohol in the reaction product is important in acetalization. It was shown that the reaction of tetraalkoxy silanes with aliphatic and alicyclic ketones takes place in the presence of anhydrous orthophosphoric acid as a catalyst and in the absence of alcohol, forming the corresponding ketals. Eight ketals were obtained and identified in this way, as well as the acetal of butyraldehyde. The opinion expressed in publications that aldehydes are acetalized more easily than ketones may only be explained by the fact that ketals hydrolyze more rapidly than aldehyde acetals. Yu.N. Platonov is thanked for making the analyses. There are 1 figure, 1 table, and 26 references: 14 Soviet-bloc and 12 non-Soviet-bloc. The 2 references to English-language publications read as follows: H.E. Carswell, H. Adkins, J.Am.Chem.Soc., 50, 235, (1928); G.I. Pfeifer, H. Adkins, J.Am.Chem.Soc., 53, 1043 (1931).

AUTHOR: Rabkova, Ye. K.

TITLE: Investigations of the Erosive Flood Water Currents in the Foot-hill Area of Northern Ferghana (Issledovaniya selevykh potokov v rayone predgoriy Severnoy Fergany)

PERIODICAL: Tr. In-ta sooruzh. AN UzSSR, 1955, Nr 7, pp 187-201

ABSTRACT: An account of investigations performed at the river-bed-control laboratory of the Institut sooruzhenii AN UzSSR (Structures Institute, Academy of Sciences, Uzbek SSR) during 1953 and 1954. The author analyzes the physical geography and the meteorological conditions that lead to the formation of flood-water currents which erode the bottomlands of Ferghana. He also offers some calculated relationships and deductions from laboratory analyses which determine the probability of the appearance - under such conditions - of the essentially turbulent flood-water currents. The presence of "structural" flood waters in Uzbekistan is denied by the author. Expanding contemporary concepts of the nature of the flood-water phenomena, with regard to "structural" flood-water currents, a tentative

Card 1/2

124-57-1-735

Investigations of the Erosive Flood (cont.)

basis of the possibility of the conservation of the flood "structure" and of a large capacity for carrying suspension in such currents is offered. In conclusion the problem on the setting up of laboratory investigations of flood-water currents, i.e., their simulation, is examined. The author is of the opinion that a turbulent flood-water current can be simulated in the laboratory in accordance with Froude's dynamic similarity criterion.

Aromatization of petroleum distillates with tungstate acid catalyst. Gyula Náray (Univ., Tech. Sci., Budapest); Mihály Károlyi. Periodica Polytechnica 30, 31-4 (1980); cf. C.A. 83, 13306. Expts. with 3 kinds of catalysts (A constg. 0.001, B constg. 0.01, and C constg. 0.06 atom W for each Al atom of the carrier, Alum. F. 10) were carried out at 530, 555, and 580°. Catalyst activity was very low below 530°. Yields diminished quickly at temps. above 580°; the rapid reduction seemed to inhibit activity considerably. Content of aromatic compds. in the products increased by 10% in the presence of catalyst A at a contact interval of 58 sec. at 530-55° and by 25% at a contact interval of 116 sec. A slightly higher output of aromatic substances was obtained with catalyst B. In the case of catalyst C the increase of output of aromatic products was 11% at 530-55° and 8% at 565-50° at a contact interval of 58 sec. If the contact interval was below this value, the output diminished. In the case of catalyst A at 585°, with a contact interval of 116 sec., the output of aromatic compds. was 35%; with catalyst B at 580°, with a 58-sec. contact interval, the yield was 26%, and with catalyst C at 580°, with a contact interval of 116 sec., the output was 80%, calcd. on the basis of petroleum distillates. Further increase of W concn. caused only slight increases of output. The optimum output of aromatic compds. depends not only on the quantity of W, but also on the method of its prepa.. The naphthalene content of the products was the highest—with an equal output of aromatic compds.—when using catalyst A; this shows that this catalyst exerted the least effect on naphthalenes. A definite difference was observed in the behavior of naphthalene compds. of different types, since cyclohexanes were transformed to aromatic compds. much easier than cyclohexanes.

✓ Possibilities for utilizing asphaltic mineral oils. J.

Varga, Gy. Rabó, and A. Székely (Versuchinst. Hochdruckforsch., Budapest). *Acta Chim. Acad. Sci. Hung.* 5, 443-51 (1965) (in German) (English summary).—Asphalts and other high-mol. materials in petroleum are converted to oils by hydrogenation in the liquid phase at moderate pressures through H transfer from Tetralin. Little coke formation is obtained at the pressures used, and the S content is reduced. Hydrogenation is carried out at 450° and 70 atm. pressure by using a space velocity of 0.6 kg./hr. and gas velocity of 2 cu. m. of synthesis gas/kg. of charge. Treatment of a Nagyngyel mineral oil with the following sp. gr., % distd. <325°, distn. residue, % S, and asphalt content; 0.921 (70°), 21.1, 77.8, 3.56, and 14.90, resp., yields a product with, resp., 0.950 (25°), 69.6, 40.5, 1.8, and 7.5. A slight further improvement in yield and quality of product can be obtained by carrying out the reaction in the presence of a catalyst used in the hydrogenation of coal tar (activated charcoal impregnated with an Fe compd.).

RABÓ, Gy.

Fuel Thermal cracking of asphaltic petroleum in presence of diluents and hydrogen. J. Varga, Gy. Rabó and A. Zalai (*BrennstChemie*, 1956, 37, 244-251). — The ~~rich~~ (3.5%) petroleum from Nagylegend, Hungary, could not be hydrogenated directly without blockages due to coking. In 1 : 1 mixture with tetrahydronaphthalene (1) it was hydrogenated at 70 atm./450° in a 3 : 1 H₂-N₂ mixture, mainly at the expense of the I, leaving naphthalene in the products. An alkaline Fe₂O₃ active C catalyst, and still more an increased pressure (300 atm.) promoted the hydrogenation. The proportion of distillate at 1 atm./325° was increased by the treatment from ~21% to ~70%. A. R. PEARSON. *3* *gjm mk*

RA 30, Cr

Treatment of hard asphalt-containing oils. Nagynyo, műsz Kísérleti Intézet (István Varró, Gyula Lőrincz, Andor Zalai, and Pál Steinmann, inventors). Ger. (East) 14-805, June 9, 1958 (Cl. 236, 1e). Lignite low-temp. tars, coal tars, hard asphalt-contg. crude oils, or other hard asphalt-contg. oils are mixed with addnl. hydrocarbons in such a ratio that the components boiling up to 350° amount to 30-80% of the mixt. The mixt. is then treated with H at 425° and 10-70 atm., fluidized catalysts of weak hydrogenation effect being used. Under these reaction conditions, the addnl. oils must be present mainly in the g/m phase; their amt. depends on the asphalt, H, and high- or medium-boiling oil content of the starting material and on the degree of hard-asphalt decompn. The catalysts used are natural or artificial silicates, Al_2O_3 , and especially powd. charcoal or coke activated with Fe_2O_3 . The reaction product may pass through 2 or more reactors. Thus, 100 kg. crude oil of d₄₀ 0.924, contg. 20.6% by wt. hydrocarbons boiling up to 325°, 3.8% S, and 14.4% hard asphalt was mixed with 100 kg. oils, b.p. 107-205°, d₄₀ 0.816. The mixt was introduced into a tube reactor with 2 cm. id. gas contg. 70% H and 4 g. charcoal- Fe_2O_3 catalyst and heated to 440°. The pressure was 70 atm.; the space velocity 0.6 kg./l./hr., referred to the vol. of a 2nd reactor which is connected to the 1st one. The reaction product was continuously removed, cooled, and a ppt. recovered and worked up in the usual manner. After separation, of 100 kg. addnl. oils, 90 kg. product was obtained, 70 kg. b.p. up to 350° and 20 kg. b.p. > 350°. Nearly 90% of the hard asphalt and 90% of the total S were converted. K. Schneider

PERIODICAL:

Radio, 1958, Nr 4, p 13 (USSR)

ABSTRACT:

Riga radio amateurs have not mastered the 144-146 mc and 420-425 mc bands, as was shown at the 1957 "Field Day". All clubs ultrashort wave sets should therefore work on three bands - 38-40, 144-146 and 420-425 mc to afford practice to the operators. Constructors should bear this requirement in mind.

3064. The quantitative determination of fructose in human semen. J. Raboch and J. Hradec (*Endokrinologie*, 105, No. 2, p. 171-184). One hundred and eighty one specimens of human semen were analysed photocolorimetrically for fructose by the Roe modification of the Selyanoff reaction but without deproteinisation. The specimen is kept in a calibrated vessel for 15 min. in a thermostat at 60° C. when the movement of the spermatozoa ceases. After thorough mixing, 0.1 ml is measured and diluted to 2.0 ml with distilled water. Kresocinol (2.0 ml of 0.1 per cent. soln. in 0.8 per cent. ethanol, and conc. HCl (6.0 ml) are added. The mixture is heated for 7 to 10 min. at 80° ± 0.5° C. cooled, and the colour is measured on a Klett-Summerson photocalorimeter against distilled water through a green No. 55 filter. Blank determinations are carried out in the same way without the semen. A 0.2 per cent. soln. of fructose is used for calibration. C. E. SEARLE

Examination of testicular biopsy specimens obtained from underfed patients, many of whom had been born during the war, revealed involution of the spermatogenic epithelium. Nutrition is most important for the development of the sexual organs during the first 2 yr. of life and during puberty. Bad social conditions and shortage of food lower male fertility.

Report on the results obtained in 67 men suffering from unilateral and 43 from bilateral forms of undescended testicle. Four cases were excluded from the final evaluation because they showed clinical evidence of an unmistakably decreased gonadal androgen production. An attempt was made to determine the incretory activity of the testicles in the following way: (1) determination of growth characteristics (age, height, weight, etc.); for purposes of comparison the findings obtained in 500 normal males with normal sperm production were taken. No significant differences were found, with the exception of a slight difference in height in cases of unilateral cryptorchism; (2) the average ejaculate volume in 400 normal males was compared with the average in cases of bilateral and unilateral cryptorchism; sexual abstinence was observed before the examination. The average volume of the ejaculate was invariably considerably larger in cases of bilateral cryptorchism. The values in unilateral cases were between those of the normal and those of the bilateral cases. Histological examination of biopsy specimen in 10 bilateral and 15 unilateral cases showed an increase in regressive Leydig cells in 15 cases. A detailed description is given of histopathological findings. (III, 5)

Sexol. Inst., Charles Univ., Prague - J. CLIN. ENDOCR. METAB. 1957, 17/12
(1429-1439) Tables 4

Some clinical and laboratory findings in 31 men with female-type sex chromatin (group I) were evaluated and a comparison made with the results of a similar investigation in 13 hypogonadotropic eunuchoids (group II) in whom the sex chromatin was of the male type. Differences were observed in certain growth measurements - lengths of the trunk and of the ulna, and biacromial and bitrochanteric distances - the size of the penis, the type of hair growth, and the development and course of sexual life. Obvious hypoplasia of the testes (long axis, 2 cm. or less) was found in all patients of both groups. In 11 of the 31 patients in group I, testicular biopsy showed a histopathological picture regarded as typical for the so-called Klinefelter syndrome; in 8 of the 13 hypogonadotropic eunuchoids in group II the picture was that of pre-pubertal testes. The quantity of spermatic fluid in patients of group I ranged from 0 to 7.0 ml.; in approximately half the cases the amount was less than 1.5 ml. In group II there was always less than 1.5 ml. of ejaculate. (III, 1, 5)

3048. SOME FACTORS INFLUENCING THE SECRETORY ACTIVITY OF
ACCESSORY SEXUAL GLANDS IN MEN - Některé faktory ovlivňující
sekretorickou aktivitu přidatných pohlavních zláz u mužů - Raboch J.
Sexuol. Ust., Karlovy Univ., Praha - ČAS. LÉK. ČES. 1957, 96/15 (468-
471) Graphs 1 Tables 2

A comparison was made of the average values of ejaculate volumes on 129 patients, in whom biopsy of the testes showed that azoospermia was of an obstructive, mostly inflammatory, origin (group I) and values in 120 patients whose azoospermia was of testicular origin (group II) with those in a third group in which palpitory findings in the genitals and all semen values were normal (group III). The ejaculates were classified in groups according to the number of days of sexual continence before examination (3 to 10 days). A total of 501 specimens from group I, 413 from group II, and 633 from group III were statistically analysed. The average volume of the ejaculate in patients with obstructive azoospermia was always lower and in those with azoospermia of testicular origin always higher than in normal men. This may be explained by changes of mainly inflammatory origin in obstructive azoospermias, and to altered hormonal conditions in the organism of those patients with azoospermia of testicular origin.
