

RACOVEANU, N.

Determination of sulfur dioxide in air by polarography. E. Zvină-Selegan, L. Curiadi, and N. Racoveanu. *Rev. chim.* (Bucharest) 9, 39-44 (1958).—A comparative study was carried out to det. SO_2 in air by polarography, colorimetry, iodometry, conductometry, and nephelometry. The SO_2 was absorbed in water or in a 5% soln. of alc., sugar, or glycerol, and polarographed in the presence of air, from a soln. contg. 3 ml. 0.1N HCl 5 ml., into which 2 drops of 0.1% methyl red was added. The sensitivity limits for the 5 methods were: 0.8 γ for colorimetry, 2 γ for nephelometry, 10 γ for conductometry and polarography, and 14 γ SO_2 for iodometry. Only the nephelometric and polarographic procedures are specific for SO_2 . 10 references. R. M.

Engineer

TITLE: A new circuit for a linear-variable voltage generator

PERIODICAL: Telecomunicații, no. 2, 1962, 67-70

TEXT: The article describes a new linear-variable voltage generator and its operational elements, i.e. the linear dipole, the thyatron, and the cathode follower. Figure 8 shows the circuit of the generator. The charging or discharging control of the capacitor is accomplished by "self-excitation". The capacitor is charged by a gas discharge tube, which has an increasing slope of the anodic current of approx. $0.25 \text{ v}/\mu\text{sec}$. The time constant of the circuit is very small. The rough variation of the output voltage frequency is accomplished by the switch c, while the fine variation of the frequency is achieved by the potentiometer P, which may also be used for the control of the amplitude of the output voltage. The potentiometer P_1 is used for the compensation of the amplitude variation of the output voltage and for the fine tuning of the frequency.

A new circuit for ...

The generator has the following performances: recovery time, $T_l = (1.5 \div 12.0)$ msec; time of the linear variation, $T_l = (0.1 - 2)$ sec; maximum amplitude of the linear-variable voltage,

$$U_{\max} = 280 \text{ v};$$

increasing speed of the linear-variable voltage,

$$\frac{U_{\max}}{T_{l \max}} = 140 \text{ v/sec};$$

non-linearity factor,

$$\beta = \frac{\left(\frac{dU}{dt}\right)_{\text{in}} - \left(\frac{dU}{dt}\right)_{\text{fin}}}{\left(\frac{dU}{dt}\right)_{\text{in}}} \times 100 = 0.5\%.$$

2107. RACOVEANU V. and ANGHELIDE R. Contribuții la studiul etiologiei și evoluției fibromului nazo-faringian. Aetiology and evolution of nasopharyngeal fibroma OTO-RINO-LARING. (București) (3-9) Illus. 2

It is considered that this affection is most frequently observed in Rumania in patients living in rural districts. This fact is explained by the frequency of rhinopharyngeal inflammations maintained by chronic tonsillitis. In the course of the past few years one has likewise observed a reduction in the number of cases of nasopharyngeal fibroma, due to the systematic anti-adenoid campaign and to the raising of the level of sanitary education of the population. It was found that in the majority of cases the tumour develops in childhood, which is explainable by the precocity of the psycho-intellectual and neuro-endocrine development of the children of the contemporary generation. Nasopharyngeal fibroma develops nearly exclusively in the male sex. However, 1 case of an 11-year-old girl is reported. The classical assertion that the tumour may take root in the sphenomaxillary region is denied. It is stated that the tumour is always rooted in the pterygo-ethmoid region. Contrary to the classical assertions, it is also stated that relapses are fairly frequent and are inversely proportional to the age of the patients. As to the classical theory that the tumour regresses spontaneously towards the age of

2107

30, it is declared that this is contestable and that waiting may be fatal to the patient.

Laryngol., Inst. pour le Perfectionnement des Méd., Hôp. Filantropia,
Bucarest - BRONCHES 1958, 8/3 (298-304) Illus. 2

These haemoptyses sometimes started spontaneously, sometimes after severe
coughing which often began with a change in attitude and sometimes ended in a sort
of cold or asthma-like attack. In all cases the quantities of blood were small.
Probably, the nervous irritation brought about by the sutures causes part of these
phenomena. Bronchoscopy often failed to indicate the cause, but the clinical develop-
ment revealed it: after one or more sutures were coughed up, the symptoms
disappeared. Kromsigt - Emmen (XV, 9, 11)

Disinfection of Tobacco Seeds by Heating.

1957, 1, 176-188

Heating seeds in special revolving drums for 1 hour at 45-50° in addition to destroying the carriers of bacterial and fungus diseases, secures an increase in the yielding ability of tobacco leaves by 10% and improves the quality of the crop (a 30% increase in the yield of the first grade). Seeds can tolerate heating up to 140° for 4 hours without lowering their sowing attributes. The method was tested on an area of 200 ha and is recommended for practical utilization. — A. N. Smirnov

ABSTRACT: In a study of parainfluenza hemagglutination inhibition antibodies carried out on 500 human serum samples, the authors found that the most widespread type determining the highest antibody level in the population is the type 3. Next are type 1 (Copenhagen and Sendai), and less frequent is type 2 (CA). Ecaterina Ghenescu performed technical work. The authors thank Doctor N. Gaicu and Eugenia Lungu for preparing the tissue cultures. Orig. art. has: 2 figures and 2 tables. [Based on authors' Eng. abst.] [JPRS: 32,913]

"Experience with a New Antihypertensive Drug Combination."

Budapest, Orvosi Hetilap, Vol 107, No 41, 9 Oct 66, pages 1940-1942.

Abstract: [Author's Hungarian summary modified] Results of a study of 47 selected cases of hypertension led to the conclusion that Navidrex, as a saldiuretic component, will effectively supplement the sympathetic inhibitor effect of Ismelin and, with few exceptions, it will considerably decrease resistance hypertension in patients who do not respond to other anti-hypertensive drugs. The number and degree of side effects is negligible, the compound was well tolerated by all of the patients. An additional advantage of the compound is the fact that the low salt diet, considered very unpleasant by most of the patients, need not be prescribed. 4 Hungarian, 1 Western references.

3. Determination of the solubility of gases and gas mixtures. (In German) G. Schay, Gy. Székely, Gy. Rácz, G. Traply. *Periodica Polytechnica, Chemical Engineering*, Vol. 2, 1958, No. 1, pp. 1-24, 20 figs., 4 tabs.

Methods of measuring the chromatographic adsorption or mixed adsorption, described in previous papers,* were applied for determining the solubility of gases in liquids. The liquid was taken up by an inert carrier. The wet carrier was filled into a chromatographic column and the gas or gas mixture was chromatographed through the latter. The absorbed quantity was determined from the material balance. The latter takes into consideration the quantity and composition of the gases entering and leaving the column. The basic equation is $w = v(1-x) + xsc$ where w and v are the space velocities of the entering and exit gases, c is the linear traveling velocity of the front, s the void corresponding to unit length of the column, x the mole fraction of the soluble gas in its mixture with an inert gas. Chromatographic indication took place with a continuous soap film velocity detector. When measuring mixed adsorption the determination of the composition of the equilibrium gaseous phase is unnecessary, total pressure is constant (1 atm) and the equilibrium composition of the gases can be predicted. Equilibrium data are obtained only with low-viscosity solvents. An apparatus for measuring individual adsorption below and above room temperature is described.

librium gaseous phase is unnecessary, total pressure is constant (1 atm) and the equilibrium composition of the gases can be predicted. Equilibrium data are obtained only with low-viscosity solvents. An apparatus for measuring individual adsorption below and above room temperature is described.

 ABSTRACT : A dynamic method of measurement of the solubility (m) of gases in liquids is described. For this purpose, a gas is passed through a chromatographical column filled with a carrier through which a solvent has been passed previously. The results of the measurement of m coincide with the data of static measurements for solvents with low viscosity and small surface tension; with high viscosity, sharply

28. Effect of quick slip changes on the torque of asynchronous motors — A slip gyors változásának hatása az aszinkron motorok nyomatékára — I. Rács (Electrical Engineering — Elektrotechnika — Vol. 45, 1952, No. 10, pp. 311–320, 11 figs)

The torque of accelerating asynchronous motors differs from the value that would present itself at an unchanging rpm. The deviation increases with growing angular acceleration ϵ and with decreasing pull-out slip s_p , thus depending upon the ratio ϵ/s_p . Disregarding the ohmic resistance of the stator, the temporal process of fluxes and torque can be plotted simply for motion of the rotor. In case of constant acceleration, torque can be computed by applying the *Fresnel* function. At low amplitude oscillations the flux and current vectors, containing the complex number j , vary with circular frequency Ω . The variations can be determined simply by introducing the complex numbers $(i\Omega)$ for the second time. Thus the attenuation and synchronizing torques and the kinetic impedance are easily computable in the function of Ω .

72. Rába river channel regulation by cutoffs, J. RÁCZ.
Vízügyi Közlemények. 1956. No. 1. pp. 36-71, 26 figs.

Planned and uniform regulation of the Rába river was completed between 1886 and 1893. Within the scope of mean-flow control the Sárköz-Győr reach was reduced to about 2/3 of the original length by 77 cutoffs. Survey in 1953 proved that the length of the above mentioned reach had increased by 4% in spite of several cutoffs during the past 60 years. The paper summarizes the experiences gathered during the execution of the three most important cutoffs in later years. It is sufficient to dig a master ditch in 1/4 to 1/6 of the planned width at a 10 to 20 cm/km slope in the coarse gravel sediment; at the height of the planned water surface elevation this width may be reduced at the bottom to 2 to 3 m. The dike in the old channel is most economically built of rough stone (riprap) dumped from a trestle.

83. Transient phenomena of double-cage motors, I. (In German) I. R. A. e. z., *Periodica Polytechnica, Electrical Engineering*, Vol. 42, 1957, No. 3, pp. 215-232, 10 figs., 1 tab.

The electromagnetic transient phenomena of the stationary double-cage motor is dealt with. The equivalent circuit of the motor may be simplified exactly as for investigating the steady state phenomena. The

free components of the switching-on current can be calculated by means of the operator impedance of the stationary motor. In addition to the alternating current three different direct-current components arise damping with different time constants, simple approximative formulae are given for their initial values and time constants. The quickest damping component does not exert any influence since it dies off during $1/4$ cycle; the following component takes part in forming the surge current; the third one — damping slowest, though very small — is of decisive importance in the forming of the

RB 11

torque. When switching on, a torque pulsating at line frequency caused by the direct and alternating currents also arises, its initial amplitude is approximately $M_{pmax} \sim \frac{S_k}{\omega_s} \frac{R_r}{R_s + R_r}$ where S_k is the apparent volt-ampere input calculated with the steady state short-circuit current, ω_s the synchronous angular velocity, R_s the stator resistance, R_r the resultant ohmic resistance of the internal and external cage connected in parallel. A numerical example is given to demonstrate the orders of magnitude (660 kw motor). The transient phenomena of the motor at full speed will be dealt with in a subsequent paper.

Torque of a Synchronous Motor at Half Speed when Started as an Asynchronous One

When starting a synchronous motor as an asynchronous one, while speeding up in the vicinity of half synchronous speed irregularities of the torque may be observed. This consists compared to the torque of a normal asynchronous motor in a higher value of the torque below half speed and in a lower one above half speed. The simple graphical method described in the paper enables the determination of the lowest torque to be expected in the vicinity of half speed while starting.

82. The transient phenomena of double squirrel-cage motors, 29
II.* (In German) I. Racz. *Periodica Polytechnica, Electrical*
Engineering, Vol. 2, 1958, No. 2, pp. 91-100, 22 figs., 3
tabs.

This paper discusses the transient phenomena of the double squirrel-cage motors running at working speed assumed to be constant. A vectorial form of the voltage equation is used for the motor. The time constants of the impedances expressed by operators are illustrated by equivalent circuits. The time constants of the free currents occurring at starting the motor circuit may be calculated by simple approximate formulae, the magnitudes of the currents may be ascertained either by vector diagrams or from equations. Knowing the phenomena occurring when the motor circuit is made, the short-circuit and change-over currents may be obtained on the principle of superposition. To illustrate the orders of magnitude a numerical example is given.
