Synthesis of antioxidation additives containing phosphorus. M. Gerasimov, D. Rushev, and A. Radoikov (Chem. Technol. Inst., Sofia, Bulgaria). *Izvest. Vysshikh. Ucheb. Zavedenii, Nefi i Gaz* 1959, No. 10, 133-6. The esters of H_2PO_3 are widely used as antioxidn. additives in mineral oils. To study the effect of various substituents and their position in the benzene ring on the antioxidn. effect, a series of triphenylphosphite derivs. was synthesized and tested. The tests were made on transformer oil produced from Bulgarian crude oil. The highest antioxidn. effect was shown by the additives with the alkyl radical in the para position. The longer the chain of the alkyl radical, the higher is the antioxidn. effect. The additives synthesized from mixts. of phenols showed a higher antioxidn. effect than the individual additives. A. G. Streng

Title : Data on the Study of the Distribution of Trypanosoma and Trypanoplasma of Fish in Some Fish Ponds

Orig Pub : Acta veterin., 1957, 7, No 2, 5-64

Abstract : The distribution of trypanosoma and trypanoplasma in fish in some Serbian ponds was determined by the study of blood smears prepared in November-December 1956. No exact determination of trypanosoma and trypanoplasma was carried out. Trypanoloma was found mainly in young carp (32% of the fish up to one year of age were infected; 1% in ages of 1 to 2 years old; 4% in ages of 4 and more years). Trypanosoma was also found

Radojčić, M. Sur un problème topologique de la théorie
des surfaces de Riemann. Acad. Serbe Sci. Publ. Inst.
Math. 2, 11-25 (1948). (French. Serbian summary)

The author considers sheets of a simply connected
Riemann surface or, equivalently, fundamental regions in
the domain on which it is mapped. A rather detailed study
of the structure of the net of fundamental regions is under-
taken which parallels the corresponding treatment of auto-
morphic functions. The fundamental regions have vertices
which correspond to algebraic branch-points and transcen-
dental singularities on the surface, and certain limitations
concerning the location of such vertices are derived. The
results are topological in nature.

RADOJCIC, M.

Radojčić, M. Certains critères concernant le type des surfaces de Riemann à points de ramification algébriques. Acad. Serbe Sci. Publ. Inst. Math. 3, 25-52, 305-306 (1950).

This paper deals with the type problem in its classical form: conformal equivalence of a given simply-connected Riemann surface with a circle or a punctured plane. The problem is thus far unsolved; some sufficient conditions are known characterizing the strength of the boundary in terms of the length of curves or disc chains approaching the boundary or by the number of branch points or sheets in an exhaustion. The last type of criteria has been restricted to the case of a finite number of projection points of branch points. The author gives the first criterion for surfaces with infinitely many projection points, subject, however, to the following restrictive properties: (1) All branch points are algebraic; (2) the order of the branch points does not exceed a fixed constant p ; (3) the spherical distance between any two branch points is at least as large as a fixed constant ϵ . The conventional division of the surface in half-sheets is replaced by division in sheets created by cuts along radial segments connecting the branch points with the infinite point. Let G_n be one of the sheets and G , the n th generation, i.e. the collection of sheets neighboring G_{n-1} ($G \cap G_{n-1} = \emptyset$). Denote by $\delta(n)$ the number of sheets in G_n . If

$$\sum_{n=1}^{\infty} \delta(n) + \delta(1) + \dots + \delta(n_1) = \infty,$$

where n_1 depends on ν, p , and ϵ , then the surface is parabolic. The theorem is proved as an application of the Ahlfors criterion $\int^{\infty} (\rho/n(\rho)) d\rho = \infty$ [Ann. Soc. Sci. Fennicae Comment. Phys.-Math. 9, no. 6, 1-5 (1936)]. Some variations of the theorem are given. In the second part (pp. 305-306) the author, correcting his earlier (p. 47) erroneous reasoning, shows that the criterion is applicable to the Riemann surfaces of the inverse functions of elliptic functions.

1954, 11/9-10 (362-370) Tables 1 illus. 10
An examination of 991 schoolchildren revealed flat-foot in 50%. The pathogenesis
of the static flat-foot, its clinical manifestations and subjective difficulties are dis-
cussed and physical methods in prophylaxis and treatment described. Painful
flat-foot is a contraindication for functional, active treatment. First and second
grade static flat-foot require besides hydrotherapy and massage exercises and prophy-
lactic or therapeutic arch supports. Third grade flat-foot must be treated surgically.
Plantograms were of great help in this examination.

Belgrade, Narodno Zdravlje, Vol 19, No 6, 1963, pp 201-203.

Abstract: /Authors' Serbocroatian summary/ A comparison of the frequency of various blood groups of the ABO system in 244 patients suffering from cancer of the stomach with a control group of 5624 other patients originating in the same area showed that there was a statistically significant increase in the number of patients with blood group A and a simultaneous decline in the number of patients with blood group O. A statistically significant difference was not evident in an examination of the differences in the proportions of all groups as a whole, suggesting a need for further comparisons with more material so as to obtain significant results under the most severe criteria.

TITLE: Controlled studies of comparative treatment of scarlet fever with various
penicillin preparations

SOURCE: Medicinski glasnik, no. 8-9, 1965, 191-194

TOPIC TAGS: penicillin, drug effect, bacterial disease

ABSTRACT: Three groups of 50 patients each, all with scarlet fever, were treated
with either an oral preparation of penicillin, an injectable penicillin, or
long-acting benzathine penicillin: while all 3 preparations were about equally
effective on an immediate basis, the third was best in preventing reinfection or
recurrence (46% versus 30% versus 6% recurrence). Orig. art. has: 4 figures.

"Etiology and Clinical Picture of Bell's Paralysis of the Facial Nerve"

Belgrade, Srpski arhiv za celokupno lekarstvo, Vol 93, No 10, Oct 1965, pp 911-917

Abstract: The authors present a statistical review of clinical material establishing the most frequent etiological factors causing Bell's paralysis. A total of 138 patients were examined, 107 children and 31 adults. The disease appeared equally in both sexes on the left and right sides. It was found that exposure to cold played a very small role. The cases are clearly divided into two groups: the larger one, where no etiological factors could be determined, and the other, where virus infections could be justifiably assumed. Future investigations will result in the significant decrease of the idiopathic group of Bell's paralysis. 4 Yugoslav, 21 Western references. Manuscript received 13 Jul 1965.

1/1

and recovery was necessary for 13.22% patients. The results during three weeks was necessary for 13.22% patients. The results obtained are compared with those of other authors, and they were found to be good and rapid. 3 Eastern, 8 Western references. Manuscript received 13 Aug 65.
