Yeast sedimentation in continuous fermentation of hydrolyzates. M. Ya. Kalyuzhnyi, M. K. Raitsev, and V. A. Utenkova (All-Union Sci. Research Inst. Hydrolysis and Sulfite Alc. Ind., Leningrad). *Mikrobiologiya* 21, 348-52 (1955).—Yeast sedimentation is slower in filtered than in unfiltered mashes. Factors influencing the rate include cell count, sugar concn., and motion in the mash. Up to 20 g./l. the yeast is easy to hold in suspension and there is not much sediment, whether the mash was filtered or not. Sedimented yeast ferments more slowly and yields less alc. than suspended yeast. Wood hydrolyzates should be fermented at a yeast content of 15-20 g./l., with systematic sepn. of settled yeast. TITLE: The mechanism governing the effect of preliminary irradiation on the thermal decomposition of alkali metal permanganates

SOURCE: AN SSSR. Doklady, v. 166, no. 4, 1966, 891-893

TOPIC TAGS: thermal decomposition, radiolysis, manganese compound, permanganate

ABSTRACT: It is an accepted hypothesis that the acceleration in the thermal decomposition of irradiated permanganates is caused by radiochemical processes which form radiolysis products. The present study was carried out in order to find out which of these products can act as catalysts and how the mechanism of this process

UDC: 537.57 + 541.17

L 21189-66

ACC NR: AP6008051

can be interpreted. It is shown that factors which increase the concentration of free electrons or MnO_4^- ions in the permanganate lattice cause a decrease in the rate of thermal decomposition (e. g., the introduction of manganate ion into potassium and cesium permanganate crystals by cocrystallization from aqueous solutions). The solid radiolysis product catalyzing the thermal decomposition of irradiated permanganates is thought to be MnO_2 and the acceleration effect results from the combination of the following factors acting in two opposite directions: the accelerating effect of MnO_2 and inhibiting effect of MnO_4^- , both of which are formed during the radiolysis of permanganates. The paper was presented by Academician V. V. Voyevodskiy on 7 June 1965. Orig. art. has: 1 figure.

tion, structure, and function). In the 2nd series of experiments one testicle and half of the other were removed in 11 guinea pigs, in 12 other animals only half of a testicle was removed, and 12 animals served as a control. All animals were administered a daily 4 mg dose of sinestrol for 2 mos. With the removal of half a testicle, sinestrol administration produced a toxic effect on the animal organism (weight of body and testicles was reduced, weight of the hypophysis increased; unless testicle structure underwent complete atrophy, it did not differ from that of control animals receiving sinestrol). With a 75% removal of testicles the administration of large doses of sinestrol did not produce a toxic effect on the animals. The remaining part of the testicle did not regenerate and did not undergo structural changes. Results were similar for experiments on monkeys.

RIFTSYN, G.A.

The solvent effect on the reaction kinetics of some fatty acids with sodium β -IT. A. Miskinova and G. A. Raftsyn (Electrotech. Inst., Moscow). Doklady Akad. Nauk S.S.S.R. 110, 238-40 (1958); cf. C.A. 50, 15188c. The reactions of solid Na with butyric and lauric acids were studied; as described in the earlier paper. The solvents were dioxane purified by repeated freezing. The solvents studied: C_6H_6 , o - $C_6H_4Me_2$, n - C_8H_{18} , iso - C_8H_{18} , and C_8H_{18} . The reaction rate with butyric acid in different solvents decreases from aromatic hydrocarbons to paraffins, through dioxane, and then sharply to C_6H_6 and paraffin oil. The reaction rates in paraffin oil and C_6H_6 are, resp., 0.0125 and 0.0025 times that in C_6H_6 . The apparent reaction activation energy calcd. from tests at 20, 30, and 40° in benzene and iso - C_8H_{18} was about 13,500 cal./mol.; in dioxane 15,000 cal./mole.; this indicated that kinetic factors det. the reaction rate, and not the diffusional rate. TITLE: To specialize the Teaching of Chemistry (Prepodavaniye khimii
priblizhit' k spetsial'nosti)

PERIODICAL: Vestnik vysshey shkoly, 1958, Nr 7, pp 9-14 (USSR)

ABSTRACT: The authors stress the necessity of a complete revision in
chemistry teaching methods in vuzes and vtuzes. Though the
teaching of chemistry has improved, there is still a tendency
to consider this a secondary science. The theoretical part
of the chemistry program must be unified, but the choice of
practical laboratory tuition must be left entirely to the in-
dividual chairs of higher schools.
There are 4 references, 2 of which are Soviet and 2 American.

TITLE: A Device for Demonstrating the Bump of Current
(Pribor dlya demonstratsii broska toka)

PERIODICAL: Professional'no-tehnicheskoye obrazovaniye, 1959, Nr 3,
p 22 (USSR)

ABSTRACT: To demonstrate the phenomenon of a bump of current, a visual training device has been constructed (Fig 1). It consists of an incandescent lamp, 2 foil safety fuses which do not work simultaneously when the device is switched on, a switch, the slider of which slips over 4 lamellas, 2 alarm lamps connected in parallel with each fuse. When the switch is operated, the slider gets off the dead lamella and closes the electric load circuit causing the fuse to blow out. At the same time, the alarm lamp ignites thus demonstrating visually the presence of current in the circuit. The construction and operation of the device are described in detail. There are 3 diagrams, 1 photograph and 1 circuit.

RAYUK, C.F.
DYSENTERY

"The Operational Experience of the Cabinet for Intestinal Infections of the United Clinical Hospital", by C.F. Rayuk and Ye.A. Chernysheva, Sovetskoye Zdravookhraneniye Kirgizii, No 3, May-June 1957, pp 52-54.

Of the intestinal infections, dysentery is at present the focal point of attention of public health organs, medical practitioners and scientific institutions. "The clinico-anatomical concept of dysentery" has recently been expanded by Soviet scientists. It is attributed to the atypical and light forms of intestinal infections which, notwithstanding the fact that they are caused by dysenteric rod-shaped bacterium of the Sonne strain, had previously been considered as having a different etiology. But the atypical, eroded forms of acute, and especially chronic dysentery are the ones responsible for epidemics. These diagnostics, however, render considerable difficulties to a practising physician, especially under infirmary-polyclinical conditions.

51-57

The Institute of Botany of
the Academy of Sciences, Muzuk SSR
has developed a method for the control of the fruit
tree diseases caused by the fungus *Ascochyta blight*. The
method is based on the use of a biological preparation of
the fungus *Ascochyta blight* and the use of the fungus
to control the disease. The method is superior
to the chemical method and is more effective in the
control of the disease. The method is based on the
use of the fungus *Ascochyta blight* to control the
disease.

TITLE: Calculating the external characteristics of a static electromagnetic frequency doubler that has a complex load and with an allowance for its higher harmonics

SOURCE: IVUZ. Elektromekhanika, no. 1, 1964, 86-92

TOPIC TAGS: frequency doubler, frequency doubler characteristics, frequency doubler characteristics calculation, electromagnetic frequency doubler, static frequency doubler

ABSTRACT: The proposed method is based on approximating the principal hysteresis curve by this hyperbolic sine: $H = \alpha \operatorname{sh} \beta B$, where α and β are coefficients that describe the quality of the core material. The resistance, primary and secondary leakage fluxes, hysteresis and eddy-current losses are

Card 1/2

ACCESSION NR: AP4018290

neglected; the second and fourth harmonic currents in the d-c reactor are assumed to be practically nil. With these assumptions, two approximate equations are developed which link the instantaneous values of the currents and magnetic fluxes of higher harmonics, and their respective phase shifts. The equations were solved on a "Strela" digital computer for a practical frequency-doubler case. The external characteristics thus obtained were compared with those experimentally arrived at and exhibited a much better agreement than the characteristics computed by methods already known. Orig. art. has: 6 figures, 20 formulas, and 1 table.

TITLE: Calculating the No-load Operation of a Frequency Doubler
(Raschet rezhima kholostogo khoda udvoitelya chastoty)

PERIODICAL: Elektrichestvo, 1959, Nr 5, pp 66-67 (USSR)

ABSTRACT: In the secondary winding of the frequency doubler, the emf of the even-numbered harmonics are induced. The spectrum of these emf contains the second, fourth and higher even-numbered harmonics. The relationship between them depends, to a great extent, on the intensity of the feeding voltage and on that of the premagnetizing current (Ref 5). A relatively simple and practicable method of an analytical calculation of the no-load process of a frequency doubler which permits the fourth harmonic to be considered is given here. In principle, it is not difficult to consider the higher harmonics, but their influence is usually unimportant. The calculation given here neglects the effective resistance and the fluxes of dispersion force of the primary and secondary windings as well as the hysteresis and eddy-current losses in the cores. Besides, it is assumed that the choke connected to the circuit of the premagnetizing winding offers such resistance that

Card 1/3

SOV/105-59-5-15/29

Calculating the No-load Operation of a Frequency Doubler

the current with double frequency is practically missing in this circuit. It is assumed that the main magnetizing curve is approximated by the formula $H = \alpha \operatorname{sh} \beta B$, α and β being coefficients characterizing the quality of the magnet material composing the cores of the frequency doubler. This form of approximation permits the main magnetizing curve at a relatively weak nonlinearity to be expressed with sufficient accuracy in an analytical form. Formula (1) is given for the magnetic state of the core at a stabilizing idle running where the secondary winding of the frequency doubler is open. This equation (1) is solved, and (2) is obtained. Only the second and fourth harmonics are considered, and formula (3) is obtained. The θ_0 , θ_2 and θ_4 contained in it are found with the aid of the method of the least squares: formulas (4), (5) and (6). Figure 2 shows these functions in form of a diagram. The analysis gives the following results: 1) For the investigated range of the parameters θ_1 and h_0 , the amplitude of the fourth harmonic of the output voltage of the frequency doubler can amount up to 40% of the amplitude of the second harmonic. 2) At an unchanged feeding voltage, i.e. at an unchanged θ_1 value,

Card 2/3

SOV/105-59-5-15/29

Calculating the No-load Operation of a Frequency Doubler

the fraction of the fourth harmonic at the output voltage of the frequency doubler decreases with an increase in the pre-magnetizing current. 3) In the range of $\theta_1 = 5.5 - 6.5$ at $h_0 = 300 - 500$, a maximum of θ_2/θ_1 is present. This maximum is equal to 0.43 - 0.44. From formulas (5) and (6), the effective voltage value at the output of the secondary winding of the frequency doubler can be determined: formula (7). - The relations put forward here were tested on a frequency doubler of electrotechnical steel E42, and the tests carried out confirmed that the fraction of the fourth harmonic at the output voltage increases with an increase in θ_1 at an unchanged h_0 . There are 3 figures, 1 table, and 8 Soviet references.

TITLE: Method of separating selenium and tellurium. Class 12, No. 170921

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 10, 1965, 19

TOPIC TAGS: separation method, selenium, tellurium, selenium separation, tellurium separation, iodine monochloride, iodine monochloride catalyst

ABSTRACT: A method of separating selenium and tellurium by treating solutions containing selenious and tellurous acids with a reducing agent in hydrochloric acid medium with subsequent separation of the precipitated free selenium from the solution. The method is characterized by the fact that in order to increase the purity of the products of separation and increase their yield trivalent arsenic is used as reducer, and the reduction is carried out in the presence of iodine monochloride as catalyst.
