1954. REHAK P. Budapesti Orvostud. Egyetem Fül-, Orr-, Gégekin.; Szabolcs utcai Állami Kórház Fül-, Orr-, Gégeosztályának. *Adatok a homloküreg sebészetéhez. Contributions to the surgery of the sinus frontalis. FÜL-ORR-GÉGEGY. 1955, 2 (33-40) Illus. 5

Suspected allergy and the widespread use of antibiotics sometimes render the diagnosis of inflammations of the frontal sinuses very difficult. Case no. 1: A female of 61 yr. had had a left Luc-Caldwell operation and many sinus operations on the ethmoids when first seen by the author. The supra-orbital region was very tender. On trying to infiltrate it with procaine, the needle penetrated through the atrophic bone and sterile pus was aspirated. A radical operation led to cure. A remarkable feature was that the X-ray was negative, because the bone was transparent. Case no. 2 occurred in a male of 25 yr. A frontal sinusitis had been treated elsewhere with penicillin. The patient improved, but was not cured. About 6 weeks later operation was inevitable. Extensive destruction of the bone of both the anterior and the posterior surfaces of the sinus was found and the dura was exposed. Recovery was obtained. Case no. 3: A young man was admitted to hospital for operation on the maxillary sinuses, because endonasal operations on the ethmoids and rinsing of the sinuses did not relieve his headaches. A symmetrical swelling on the glabella was noticed but only at operation (not on the X-ray) was a profuse suppuration on both sides of the frontal sinus found. Radical operation was performed and recovery followed. Case no. 4 occurred in a female of 61. During the past 30 yr. polyps of the nose had been removed 22 times. Exacerbation with oedema of the eyelids occurred. Operation released a great amount of pus from the frontal sinuses. Several operations were necessary on the other sinuses to obtain cure. The polyposis has returned.

operative synovitis of the knee - prevention - treatment
- rehabilitation BRATISLAVSKÉ LEKÁRSKÉ LISTY 1954, 34/8 (362-367)
The diagnosis and treatment are described based on the analysis of 609 injuries
of the knee and 102 operations. There was post-injury synovitis in 20.3% and post-
operative synovitis in 17.6% of the cases. The use of intravenous infusion of novocaine
in both injury synovitis and postoperative synovitis is described. It was
successfully employed in 17 operation cases. Kliger - Bronx, N.Y.

"Unusual Injury Caused by Electrical Current."

Prague, Vojenske Zdravotnicke Listy, Vol 36, No 1, Feb 67, pp 35 - 37

Abstract: A 19 year old trainee of the Aeronautical Institute was demonstrating an aircraft flying model; the model hit electric power lines of 22,000 V. The metal cables of the model were burned and the man received burns on all fingers of the right hand. The current passed through the whole body and entered the ground through the heels of the shoes. The patient remained unconscious and died 8 hours 25 minutes later in spite of an attempted resuscitation. Artificial respiration was applied within 4-5 minutes, and the patient was brought to the hospital 17 minutes after the accident. 6 Figures, 20 Western, 1

1501. ATTEMPT TO BLOCK OCULO-OCULAR REACTIONS OF INTRAOCULAR PRESSURE IN EXPERIMENTAL ANIMALS - Pokus blokádu okulookulárních reakcí nitroočního tlaku u pokusných zvířat - Řehák S. and Vrána M. Oční Klin. a Kat. Exp. Patol., VLA J. Ev. P., Hrádec Králové - CSL. OFTHAL. 1958, 14/5 (327-331)

The authors performed 156 experiments, in which they endeavoured to block the oculo-ocular pressure reaction: (1) after isolated stimulation of pressoreceptors, by increasing or decreasing the intraocular pressure of the stimulated eye; (2) after paracentesis of the anterior chamber; and (3) after subconjunctival injection of hypertonic saline solution. In the first group of experiments, transmission of reactions was blocked by retrobulbar injection of procaine on the stimulated side; in the 2nd group, novocaine was given by retrobulbar injection on the measured side; in the 3rd group, the central division of the visual pathway was blocked by chlorpromazine. The results of all experiments were statistically evaluated, and compared with those from a control group of 52 individuals. Statistical evaluation confirmed the original supposition about the nervous transmission of impulses causing oculo-ocular pressure reactions: It was possible to eliminate these reactions by blockade of the afferent and efferent pathways, as well as by blockade of the central part of the nervous arc with chlorpromazine. These experiments confirm the great importance of good anaesthesia, and of the application of neuroplegics, in antiglaucomatous operations.

A consensual fall of intraocular pressure was observed in the majority of 34 patients after antiglaucomatous operation. The fall was obvious in 2/3 of the patients at the end of one week and in 1/3 of all patients a favourable effect of the operation on the intraocular pressure of the fellow eye was seen 3 weeks after operation. It is better to perform the antiglaucomatous operation on the most affected eye first. Its fellow eye may also benefit and there the glaucoma may have a favourable course.

AUTHOR: Řehák, Vladimír
TITLE: Prospects of machine translation
PERIODICAL: Tehnika, no. 1, 1963, 24-24a

TEXT: Problems facing linguists, mathematicians and engineers in connection with the development of machine translation (from typescript to typescript) are discussed, and various fields of application of such translations are indicated.

TITLE : Laboratory Mixer with Circular Motion

ORIG. PUB. : Chem. prumysl, 1959, 9, No 1. 27
ABSTRACT : A laboratory mixer for simultaneous mixing
of liquid in 9 chemical flasks consists of
a board on which the flasks are fitted. The
board is suspended in a horizontal position
on silane strings and is connected to the
eccentric of a 35 v motor.

1217. ISOLATION OF COXIELLA BURNETII FROM THE TICK IXODES RICINUS -
Isolace Coxiella burneti z klište Ixodes ricinus - Rehn F. and Radvan
R. Vojenská Lék. Akad. J. Ev. Purkyně, Hradec Králové - ČSL. EPIDEM.
MIKROBIOL. IMUN. 1957, 6/2 (85-88) Tables 1

Hungry nymphae and imagos of the tick Ixodes ricinus captured in south-eastern Bohemia were examined. The region from which the ticks were obtained was a natural focus of tick-borne encephalitis and lymphocytic choriomeningitis. C. burnetii was isolated. The strain showed minimal antigenicity on homologous antiserum and in crossed complement fixation a mutually different relation to the Henzering strain and the strain isolated in Switzerland. During serological testing of wild and domestic animals positive titres were obtained from a roe, a pheasant and a cow.
