PHASE I BOOK EXPLOITATION

SOV/1458

Dosyahnennya suchasnoyi fizyky, vyp. 5 (Achievements of Modern Physics, nr. 5) Kiyev, Radyans'ka shkola, 1957. 310 p. 3,500 copies printed.

Compilers: O.Z. Zhmuds'kyy, Candidate of Physical and Mathematical Sciences, Docent, and M.Ye. Hurtovyy; Ed. (Title page): O.Z. Zhmuds'kyy, Candidate of Physical and Mathematical Sciences, Docent; Ed. (Inside book): A.S. Kryvosheya; Tech. Ed.: N.K. Volkova.

PURPOSE: This book is intended for physics students at vuzes.

COVERAGE: The 22 articles in this collection have been translated into Ukrainian from Russian language articles which originally appeared in Atomnaya energiya, Priroda, and other Soviet periodicals. They were written by 23 physicists, including such eminent scholars as Kurchatov, Blokhintsev, and Veksler. The book attempts to provide a simple account of some of the recent Soviet advances in nuclear research and in the industrial application of nuclear energy. In discussing the present-day exploitation of atomic power and its potential for peacetime uses, some authors also outline a guide for future goals. Each

Card 1/5

Achievements of Modern Physics (Cont.)

SOV/1458

chapter deals with one particular problem and gives a concise statement of the modern Soviet theory about it. Among the central topics dealt with in the book are power generation through nuclear reactors, physics and the application of semiconductors, the development of new high-energy particles and radioelements, and changes brought about in production engineering by the ever increasing use of radioactive substances. Radiation effects in the auroral zone of the Arctic, television transmitters aboard Earth satellites, and technological aspects of high-pressure phenomena also come within the scope of this collection. The book contains diagrams, photographs, and a few scattered Soviet references in the text.

TITLE: Discovery of the Element 102 (Otkryt element 102)

PERIODICAL: Nauka i Zhizn', 1957, # 12, p 47 (USSR)

ABSTRACT: In July 1957 the discovery of the new element, No.102, was announced by a group of Swedish scientists. The new element was obtained by bringing particles of the curie element (element No.96) into contact with carbon ions, accelerated in a cyclotron. The new element has the mass 253 and is extremely unstable. Its period of semi-decomposition is from 10-12 minutes, emitting alpha particles with an energy of 8.5 Mev.

Conference in Moscow (Konferentsiya v Moskve)

PERIODICAL: Vestnik Akademii Nauk SSSR, 1958, Nr 2, pp 108-110  
(USSR)

ABSTRACT: This conference took place from December 2 to December 4, 1957. It was called by the Commission for Analytical Chemistry of the Institute for Geochemistry and Analytical Chemistry imeni V.I. Vernadskiy of the AN USSR. About 450 scientists from 40 cities of the USSR took part as well as some foreign scientists: Shu Chuan-lyan, En Zhen-in, Lyu Tsin-i (China); I. Kol'tgov (USA); G. Irving (Great Britain); R. Prshibl, I. Kerbl, Ya. Malyy, I. Vodegnal, V. Bezdek (Czechoslovakia); Yu. G. Minchevskiy (Poland); L. Erdei, A. Schner (Hungary); L. S. Tutundzhich, M. V. Shushich (Yugoslavia); N. I. Petrov (Bulgaria); K. Dragulesku (Roumania);

ods of analysis:

- 1) I. P. Alimarin reported on the method of diluting isotopes (the Nb<sup>95</sup>, Zr<sup>95</sup>, and Ta<sup>182</sup> radioisotopes were used);
- 2) M. B. Neyman, V. Ya. Yefremov, V. M. Panfiliv reported on the determination of the alcohol content in the oxidation products of propylene and butane (C<sup>14</sup> was used);
- 3) G. S. Rozhavskiy, I. Ye. Zimakov reported on the method of repeated radioactive dilution for the determination of small admixtures (of the order of 10<sup>-4</sup> to 10<sup>-7</sup> %);
- 4) A. I. Kulak reported on the determination of the quantity of micro admixtures of nickel, cobalt, copper, tellurium, and antimony;
- 5) V. B. Gaydadyomov, L. I. Il'ina reported on the possibility of analyzing tantalum-niobium alloy samples in different physical states by the reflection of rays;
- 6) I. Ye. Starik reported on the method of the perfect separation of micro quantities of uranium from weighable quantities of iron by means of the isotope U<sup>233</sup>;
- 7) V. I. Kuznetsov, T. G. Akimov recommended a method for precipitating uranium;

Card 2/4

30-2-40/49

The Use of Radioactive Isotopes in Analytical Chemistry. Conference in Moscow

- 8) Professor Irving reported on the determination of indium by radioactivation analysis in rocks and minerals;
- 9) K. B. Yatsimirskiy reported on the determination of phosphate, sulfate and molybdate;
- 10) K. V. Troitskiy described two new methods of the determination of metal traces;
- 11) A. K. Lavrukhina reported on some peculiarities of radiochemical analysis;
- 12) I. M. Kol'tgov reported on the use of the radioactive isotope  $\text{ThB}(\text{Pb}^{212})$  for the investigation of the aging of crystalline sediments;
- 13) M. M. Senyavin reported on the use of radioactive isotopes in chromatography;
- 14) A. M. Yermakov, V. K. Belyayeva, I. N. Marov showed the possibilities of using anionites for the calculation of the constants of the stability of charged ions;
- 15) N. A. Izmaylova, V. S. Chernyy gave data of the investigation of the solubility of salts;

Card 3/4

30-2-40/49

The Use of Radioactive Isotopes in Analytical Chemistry. Conference in  
Moscow

- 16) A. K. Lavrukhina, S. S. Rodin investigated the co-precipitation of francium with different sediments by the short-lived radioactive isotope  $\text{Fr}^{212}$ ;
- 17) I. V. Tananayev showed the possibility of separating francium from cesium;
- 18) Yu. I. Bykovskaya, A. A. Grizik, N. I. Marunina investigated the use and the methodology of radioactive indicators;
- 19) M. I. Tsekhanskiy, N. I. Shishkin, K. V. Khudoyarov and G. D. Susloparov described the use of  $\text{Ca}^{45}$ ;
- 20) P. V. Zimakov, and L. A. Krasnousov described the use of  $\text{Cl}^{36}$ ;
- 21) K. I. Karasev reported on the use of the marked-atom method.

TITLE:

Investigation of Complex Compounds

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 8, pp 94 - 95 (USSR)

ABSTRACT:

From May 26 through 29 the 8th All-Union Conference on the Chemistry of Complex Compounds took place in Kiyev. Soviet scientists and guests from Poland and Czechoslovakia participated in the work. These compounds are used to an increasing degree, among others in the production of nuclear fuel, of auxiliary materials in atomic industry, as catalysts in the synthesis processes of high polymeric material, in biology, medicine, and in various fields of modern technology. 97 reports were presented in 2 plenary and 15 group sessions. Among others the following questions were discussed in the reports: problems of the "transeffect"; investigation of complex compounds by means of physical and physicochemical methods; investigation of the structure of complex compounds by means of optical and thermodynamic data. In the closing session the tasks arising through the Seven-Year Plan were discussed.

TITLE:

Use of Atomic Energy for Peaceful Purposes

PERIODICAL:

Vestnik Akademii nauk SSSR, 1960, Nr 1, pp 101 - 102 (USSR)

ABSTRACT:

The author describes the course of the Conference on the peaceful uses of atomic energy, held in Tashkent from September 28 to October 3, 1959. The Conference had been convened by the Akademiya nauk (Academy of Sciences) and the Nauchno-tehnicheskii komitet Soveta Ministrov Uzbekskoy SSR (Scientific-technical Committee of the Council of Ministers of the Uzbekskaya SSR). It was attended by scientists of the institutions of the Academy of Sciences of the USSR and the Academies of Sciences of the Union Republics as well as by experts in various branches of national economy. Kh. M. Abdullayev, President of the Academy of Sciences of the Uzbekskaya SSR, opened the Conference. V. I. Sinitsyn, delegate of the Glavnoye upravleniye po ispol'zovaniyu atomnoy energii pri Sovete Ministrov SSSR (Main Administration for the Use of Atomic Energy at the Council of Ministers of the USSR), reported on the prospects of the peaceful uses of atomic energy in the USSR, and G. M. Fradkin on

production of radioactive isotopes in the USSR. Over 300 reports were heard at two plenary meetings and 40 sessions of the sections, half of them being delivered by scientists of the Uzbekistan. U. A. Arifov, Director of the Institut yadernoy fiziki Akademii nauk Uzbekskoy SSR (Institute of Nuclear Physics of the Academy of Sciences of the Uzbekskaya SSR), spoke on the prospects of scientific research development at this Institute. The technical basis was offered by a recently installed reactor, generators of fast neutrons, a cobalt-gamma-radiation system. S. V. Starodubtsev, Vice President of the Academy of Sciences of the Uzbekskaya SSR, reported on the major working results obtained by the scientists of the Uzbekskaya SSR in the field of modification of the properties of solids and liquids. A survey was offered by A. K. Lavrukina on "Modern Methods of Radiochemistry". The lecturer described the work done by a group of collaborators of the Institut geokhimii i analiticheskoy khimii Akademii nauk SSSR (Institute of Geochemistry and Analytical Chemistry of the Academy of Sciences of the USSR) in the Ob'yedinennyy institut yadernykh issledovaniy (Joint Institute of Nuclear Research) at Dubna. The delegates of the Conference

AUTHORS: Lavrukhina, A.K.; Rodin, S.S.

TITLE: Radiochemical investigation of uranium fission products obtained by 660 Mev proton bombardment

PERIODICAL: Radiokhimiya, v. 2, no. 1, 1960, 83 - 93

TEXT: Fission and spallation products of uranium obtained by bombardment with 660 Mev protons were investigated radiochemically. From experimental data and results obtained by interpolation a full chart of residual nuclide products is prepared and basic regularities in their formation are determined. High-energy fission was discovered in 1947 by G.T. Seaborg et al. [Ref. 1: Phys. Rev. 72, 740 (1947)]. The present authors started in 1955 detailed radiochemical investigations of fission products (in the interval  $Z = 78 - 93$ ) obtained by 660 Mev proton bombardment of uranium. Comparison with literature data on fission products of copper and bismuth can give information concerning the dependence of fission characteristics on the atomic number of the target-element (from  $Z = 29$  up to  $Z = 92$ ). M. Linder and R. Osborn's paper [Ref. 12: Phys. Rev., 103, 378 (1956)] on fission products obtained by 100 - 340 Mev proton bombardment of ura-

Card 1/9

Radiochemical investigation of uranium fission...

nium in connection with the present results may give some informations on the effect of the bombardment energy in the range of 100 - 660 Mev on the yield of some fission and spallation products. In the present work metallic uranium foils (0.3 - 0.5 g) were bombarded in a circulating 660 Mev proton beam of the synchro-cyclotron in the laboratoriya yadernykh problem Ob'yedinennogo instituta yadernykh issledovaniy (Laboratory for Nuclear Problems of the Joint Institute of Nuclear Investigations), varying the duration from 15 min to 2 h. After irradiation the uranium foils were dissolved in  $\text{HNO}_3$  or  $\text{HCl}$  adding  $\text{H}_2\text{O}_2$ , the elements Pt, Au, Hg, Tl, Pb, Bi, Po, At, Fr, Ra, Ac, Th, Pa, U and Np were separated by chemical processes and identified by their radioactive properties. Activity measurements were carried out with a standard end-window counter [of MCT-17 (MST-17) type] and scintillation counter with  $\text{ZnS}(\text{Ag})$  crystal. In the obtained uranium fission and spallation products 42 nuclides in the interval of  $A = 188 - 237$  with a half-life  $T$  from 20 min to 140 days were identified (see Table 1). Relatively high yield of neutron-excess nuclides was observed. Data were obtained by interpolation. From the experimental and interpolation results distribution curves according to the mass number were plotted (Fig. 4) and it was demonstrated that nuclides with maximum yield are distributed close to nuclear stability curve. Distribution curves for the elements  $Z < 90$  are not in agreement with the previously observed

Card 2/9

S/186/60/002/001/014/022  
A057/A129

Radiochemical investigation of uranium fission....

tendency [Ref. 3: GYeOKhI AN SSSR, M. (1955); Ref. 5: Atomnaya energiya, 2, 345 (1957); Ref. 9: Atomnaya energiya, 2, 27 (1957); Ref. 8: T.V. Malysheva, I.P. Alimarin, ZhETF, 35, 5, 1103 (1958)] of the increasing probability for the formation of neutron-deficient nuclides with increasing n/p ratio in the bombarded nuclei. Even more surprising are the values calculated for neutron and proton emission as 5.2 or 11.7, i.e.,  $\Sigma n / \Sigma p = 2.3$ . Thus the probability of proton emission in uranium spallation is relatively high being half of the probability of neutron emission. The present authors assume that these effects are caused not only by the contribution of spallation processes, but by the greater cross section of the fragmentation process on uranium in comparison with other heavy elements [such as Au or Bi, see A.K. Lavrukhina et al., Ref. 18: Atomnaya energiya, 3, 285 (1957)]. From the yield distribution curves (Fig. 4) formation cross sections were determined, summary yield curves were plotted (Fig. 7) and thus the total fission cross section of uranium was estimated at 0.4 barn. According to Lindner (Ref. 12) after 340 Mev proton bombardment uranium fission cross section is 0.28 barn, not considering the contribution of Fr, Rn, At, Po, Bi, Pb, Tl, Hg, Au and Pt. From the present data it can be seen that the contribution of these elements is about 40% of the total fission cross section. Their formation cross section decreases twice in the energy range from 660 to 340

Card 3/9

22460

S/186/60/002/001/014/022  
A057/A129

Radiochemical investigation of uranium fission....

Mev. Thus the total fission cross section of uranium in 340 Mev bombarding is about 0.35 barn and remains constant in this proton energy range. However, formation cross sections of single fission products change considerably with increasing proton energy. The yield of Th, Ac and Ra, for instance, increases with the proton energy while the yield of U and Pa decreases (see Table 2). Decrease in U and Pa yield is explained by the fact that with increasing proton energy the mean excitation energy increases, but the probability of the transfer of a smaller part of the energy from protons to the nucleus decreases. Since U and Pa are formed at relatively small excitation energies, their yield decreases. The range of applicability of S.G. Rudstam's formula [Ref. 21: Phyl. Mag., 44, 1131 (1953)] was checked comparing the experimental curve of dependence of the cumulative yield of isobars on the number of emitted nucleons (Fig. 9) with the theoretical curve calculated by J.D. Jackson [Ref. 17: Can. J. Phys., 35, 21 (1957)]. The difference between the two curves demonstrates that emission of  $\alpha$ -particles and fission possibility of residual nuclei must be considered in the calculation of uranium fission products yield. It was observed that the experimental yield of  $Po^{210}$  ( $N = 126$ ) is about three times less than the interpolated value (Fig. 4). In previous investigations by I.A. Yutlandov [Ref. 6: RIAN SSSR, L. (1956)], A. N. Murin, I.A. Yutlandov [Ref. 7: Izv. AN SSSR, OKhN, 4, 408 (1957)] and A.K.

Card 4/9

22460

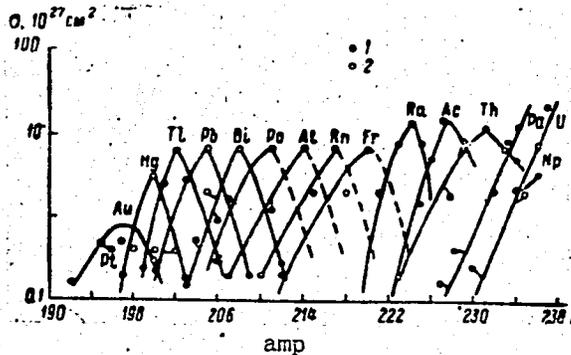

S/186/60/002/001/014/022  
A057/A129

Radiochemical investigation of uranium fission....

Lavrukhina, A.A. Pozdnyakov [Ref. 22: Atomnaya energiya, 7, 382 (1959)] the effect of shell structure on the yield of residual nuclei was also noticed. Decrease in yield of nuclides with closed shells can be explained by the static theory of nuclear reactions. The present authors thank the coworkers in the laboratory L.M. Satarov, G.V. Perfeyev and M.I. Blokhin for the help as well as V.N. Mekhedov and V.G. Solov'yev for discussing the present paper. There are 9 figures, 2 tables and 22 references: 11 Soviet-bloc and 11 non-Sviet-bloc.

TITLE: The Peaceful Atom in Action

PERIODICAL: Priroda, 1960, Nr 3, pp 107 - 109 (USSR)

ABSTRACT: A conference on the peaceful applications of atomic energy was convened in Tashkent at the end of 1959 by the Akademiya nauk Uzbekskoy SSR (Academy of Sciences of the Uzbekskaya komitet Soveta Ministrov (Scientific and Technical Committee of the Council of Ministers). Over 1,000 scientists and specialists participated and more than 300 papers were read at the 2 plenary and 40 ordinary sessions - 50% of them by Uzbek scientists. The sessions were devoted to research on nuclear physics - radiation chemistry, the uses of radio-isotopes in industry, geology, biology, medicine and agriculture. The following reports were heard: the development prospects of scientific research by U.A. Arifov, Director of the Institut yadernoy fiziki (Nuclear Physics Institute)

The Peaceful Atom in Action

Apart from the new reactor, the Uzbek Nuclear Physics Institute is equipped with a complex of fast-neutron generators, a powerful cobalt gamma-radiation installation and specially equipped physical and radio-chemical buildings. A cyclotron is under construction. In its short existence the Institute has performed much valuable research. One of its contributions is the discovery that gamma-radiation is excellent for preserving the cocoon of the mulberry silk-worm. Instruments for automating labor-wasting production-quality control-processes and production regulating processes evolved by the Institute are already in use at enterprises in Tashkent, Chirchik and Ammalyk. Radiation methods are also being used to solve the problems of supplying the virgin

TITLE:

Use of ammonium phosphotungstate for the separation of rubidium and cesium by ion exchange

PERIODICAL:

Akademiya nauk SSSR. Doklady, v. 140, no. 4, 1961, 832-834

TEXT: J. van R. Smith and co-workers (Ref. 10, see below) recently published a paper on the separation of alkali metals on an exchanger column with ammonium phosphomolybdate. J. Krtil and V. Kouřim (Ref. 11, see below) showed that the chemical stability of ammonium phosphotungstate in neutral and highly acid solution was higher than that of ammonium phosphomolybdate, and that the sorption capacity of the former salt was twice that of the latter. On the basis of these data, the authors studied the separation of the heavy alkali metals rubidium and cesium on a column filled with ammonium phosphotungstate. To reduce the high hydraulic resistance of fine-crystalline ammonium phosphotungstate, a coarse packing had to be added. A fine-fibered tremolite asbestos of the amphibolic type was used for this purpose. Silica gel, glass wool,

Card 1/4

Use of ammonium phosphotungstate . . .

cellulose, and cork crumbs were less suitable. The column used had an inside diameter of 5 mm, and was filled with a suspension of asbestos in 1 M  $\text{NH}_4\text{NO}_3$  solution up to a height of about 30 mm. A 0.2 M solution of phosphotungstic acid, and then a 0.3 M  $\text{NH}_4\text{NO}_3$  solution, were passed through this column. 0.1 ml of a 1 M  $\text{HNO}_3$  solution was then introduced which contained  $10^{-4}$  M rubidium (radiolabeled with  $\text{Rb}^{86}$ ) and  $10^{-6}$  M cesium (radiolabeled with  $\text{Cs}^{134}$ ). The absorption of  $\beta$ -radiation by an aluminum filter was used to identify the activities since the energies of  $\beta$ -particles of  $\text{Rb}^{86}$  (1.79 Mev) and  $\text{Cs}^{134}$  (0.65 Mev) are highly different. A filter of a thickness of 204  $\text{mg}/\text{cm}^2$  was used. The radioactivity of fractions obtained after separation on the column was measured in an end-window counter of the MCT-17 (MST-17) type with and without aluminum filter. The relative quantities of the two active isotopes in the fractions were calculated from the following equations:

$$A_{\text{Rb}} = 6.82 \cdot A_{\text{Al}} - 0.31 \cdot A_{\text{tot}}; \quad A_{\text{Cs}} = 1.31 \cdot A_{\text{tot}} - 6.82 \cdot A_{\text{Al}}; \quad (A_{\text{Rb}}, A_{\text{Cs}} -$$

activities of  $\text{Rb}^{86}$  and  $\text{Cs}^{134}$ , respectively;  $A_{\text{Al}}$  - total activity when

Card 2/4

B106/B110

Use of ammonium phosphotungstate ...

measuring with filter;  $A_{tot}$  - total activity without filter). Rubidium was eluted from the column, with 1 M ammonium nitrate solution cesium with 6 M ammonium nitrate solution. Fig. 1 shows the resultant chromatogram. Rb and Cs can also be separated by ammonium silicomolybdate, but this salt is more soluble in  $NH_4NO_3$  solution than ammonium phosphotungstate, and is therefore, slowly eluted from the column. The chromatograms obtained with ammonium phosphomolybdate agree with data in Ref. 10 (see below). Ammonium silicotungstate cannot be applied to chromatographic separations because of its good solubility in ammonium nitrate solutions. The chromatographic separation method described may be valuable for the separation of highly active isotopes of rubidium and cesium since phosphotungstates are very stable to radiation. There are 1 figure and 16 references: 3 Soviet and 13 non-Soviet. The three most recent references to English-language publications read as follows: Ref. 10: J. van R. Smith, W. Robb, I. I. PHASE I BOOK EXPLOITATION SOV/3135

Budyka, Ivan Nikolayevich, Viktor Ivanovich Bulanin, Solomon Abramovich Kantor, and Konstantin Georgiyevich Rodin

Atlas konstruktsiy parovykh i gazovykh turbin (Atlas of Steam and Gas Turbine Designs) Moscow, Gosenergoizdat, 1959. 9,000 copies printed. 1. Opisatel'naya chast' (Part I. Descriptive Part) 130 p. 2. Chertezhi (Part II. Drawings) 118 p.

Ed.: S. A. Kantor, Professor; Tech. Ed.: A. A. Zabrodina.

PURPOSE: This atlas is intended for students taking advanced courses in turbine design. It may also be useful to personnel of design offices in plants and planning organizations.

COVERAGE: Drawings and descriptions of basic types of Soviet steam and gas turbines are presented. Rated capacities and such auxiliary equipment as surface condensers and steam-jet ejectors are discussed. Book I contains the descriptions and general information for each turbine type, while Book II contains the drawings. The drawings in Book II correspond to the turbine types listed in Book I. For Part I of the text the corresponding

Card 1/7

Atlas of Steam (Cont.)

SOV/3135

drawings are found on Sheets 1-1 to 1-21 on pages 3 to 23 in Book II. For Part II the drawings are on Sheets 2-1 to 2-26 on pages 24 to 61; for Part III, Sheets 3-1 to 3-4 on pages 57 to 61; for Part IV, Sheets 4-1 to 4-25 on pages 62 to 89; for Part V, Sheets 5-1 to 5-10 on pages 90 to 101; and for Part VI, Sheets 6-1 to 6-17 on pages 102 to 118. The following are expansions of the three-letter designations of turbine types listed, indicating the plant where they are designed or manufactured: LMZ, Leningradskiy metallicheskiy zavod (Leningrad Metal Plant); KhTZ, Khar'kovskiy turbinnyy zavod imeni S.M. Kirova (Khar'kov Turbine Plant imeni S. M. Kirov); UTZ, Ural'skiy turbomotornyy zavod (Sverdlovsk Ural'skiy Turbine Plant); NZL, Nevskiy mashinostroitel'nyy zavod imeni V.I. Lenina (Leningrad Nevskiy Machinery Plant imeni V. I. Lenin); and KTZ, Kaluzhskiy turbinnyy zavod (Kaluzhskiy Turbine Plant). The atlas was compiled by members of the Turbine Construction Department, Leningradskiy politekhnicheskii institut imeni M. I. Kalinina (Leningrad Polytechnical Institute imeni M. I. Kalinin). I. N. Budyka wrote Parts III and IV; V.I. Bulanin wrote Part I, Paragraphs 10, 11, and 13 of Part II, and Paragraph 18 of Part IV; S. A. Kantor wrote Part VI; and K. G. Rodin wrote Parts II and V. The authors

The role of biological factors in forming takyrs along the route of the Turkmen Canal. N. I. Bazilevich, N. M. Gollerbakh, M. A. Litvinov, L. E. Rodin, and D. M. Shtefberg. *Botan. Zhur.* 38, 3-30(1953).—A slime membrane of biol. origin (algae) coats mineral particles, reduces evapn., and decreases the upward movement of salts. This in turn encourages more algal growth. The O<sub>2</sub> released in the photosynthetic processes is trapped by the fibers of the algae and when silting takes place a porous structure is formed as the O<sub>2</sub> is forced out or reacts with the medium. With more sediment the porosity is reduced by compaction and a scaly structure ensues. On the surface, cementation causes crust formation, the cementing agents being SiO<sub>2</sub>, organo-mineral gels, and carbonates of Ca and Mg. The Na of the incoming waters causes a rise in pH. It has been noted that as the algae develop on the surface after a rain the pH rises to 8.2-8.3.

composition of lower organisms, a rapid increase in the quantity of flowering plants, a substitution of annual plants by perennials, and an exchange of plants of a weak surface-root system by plants having more vigorous roots. On the described territory, there is observable a series of transitions from the geological-alluvial and primitive takyr-solonchak formations (the accumulative complex) by way of mature takyrs, in conjunction with meadow soils of sinks and hollows (the sunken-suffusive complex), to the more fertile soils of the zonal sierozem order (incipient-erosive complex with residual takyr formation in the primitive sierozem soils). From the accumulative and incipient-erosive complex, there are noted an increasing significance of the mobilizations by plants of the fertility elements and a decreasing share of the biocalogea elements (Na, Cl, excess of S). In the same plant species, depending upon

annually up to 90 kilograms per hectare of ash 9 - 14 kg. per hectare of N are added. The chief elements are N and Cl. The further drying up of the territories is accompanied by a narrowing in the sphere of small organic matter cycles to about 20 - 30 cm on the takyrs. The higher plants give way to algae and lichens. The stage of lichen covered takyrs is long and persistent. Subsequent overgrowth is composed of halophytic groups (annual saltworts, halophytic ephemera with the participation of shvednik [?]). The store of organic mass during this phase does not exceed 5-6 centners per hectare. The ash which entered was 70-80 kg. per hectare, the N 10-12 kg. per hectare. The elements Na, Cl, S predominated. The later stages of takyr overgrowth were characterized by an accumulation of organic matter of about 40 centners per hectare; the sinking amounted to 15-16 centners per hectare yearly;

the ash coming into it was 175 kg. per hectare, the N 25 kg. per hectare. The role of N and Cl sunk down to 25-30% that of the total of ash matter. During the formation of meadow serozem saline soil the accumulation of the organic matter reached 120 centners per hectare. The amount of ash entering the soil was 400-450 kg. per hectare, that of N about 80 kg. per hectare. The elements K, Ca, Si were predominant, although the role of Na, Cl, and S was significant still. An evaluation of the various types of soil complexes is given from the point of view of melioration.

Title : The Morphology of the Profile of the Takry; the Takyr  
Crust.

Orig Pub : Takry Zap. Turkmenii i puti ikh s.-kh. osvoyeniya,  
Moskva, Akad Nauk SSSR, 1956, 337-350

Abstract : The decisive factor in the formation of the takyr crust is  
the combination of the photosynthetic process effected by  
the algae and the continual fine silting going on in the  
accumulating surface waters. The innumerable O<sub>2</sub> bubbles  
given off by the algae during photosynthesis are coated  
with Ca carbonates in a very fine suspension /oblekayutsye  
Ca karbonatami tonchayshey vzves'yu/ and when cemented to-  
gether form the characteristic porous shell of the takry

APPROVED FOR RELEASE: Tuesday, August 01, 2000 CIA-RDP86-00513R001445  
Calculations have shown that up to 250 kilograms  
of O<sub>2</sub> per hectare can be secreted on the algeous takry  
over a 24 hour period. Physical phenomena also have the  
greatest significance in the formation of the crust hori-  
zon of the takry: swelling, drying up, shrinking, fissu-  
ring. The interaction of these processes, combined with  
the effect of biological processes on the soil base /poro-  
da/, leads to the formation of the takry profile.

Title : The Reasons for the Natural Infertility of the Takry and the Principles of their Amelioration.

Orig Pub : Sb. Takry Zap. Turkmenii i puti ikh s, kh. osvoyeniya, Moskva, Akad Nauk SSSR, 1956, 711-717

Abstract : The authors consider the fundamental reasons for the natural lack of fertility of the takry to be: the weak biological activity of the soils, their insignificant content of organic and fundamental nutritive substances (humus is less than 1%; N -- 0.05-0.06%; P<sub>2</sub>O<sub>5</sub> -- 0.1%), the low (10%) content of humic acids in the humus and their weak acidity [the text is confused here], general salinity of the soils, their high alkalinity (up to 0.2% HCO<sub>3</sub>; 0.04% CO<sub>3</sub>; pH 9-10), the increased content of exchange Na in the

TITLE: Main developmental periods of continental vegetation cartography

SOURCE: Botanicheskiy zhurnal, v. 50, no. 9, 1965, 1268-1275

TOPIC TAGS: botany, mapping, physical geography, cartography

ABSTRACT: In 1964 a Physicogeographical Atlas of the World prepared  
with the assistance of various scientific institutes was published by  
the Main Board of Geodesy and Cartography. This major work includes a  
large number of new detailed vegetation maps of the world drawn by a  
group of 6 Soviet geobotanists, the authors of the article. The  
literature sources for these new maps are described. The authors point  
out that the data on which the small scale vegetation maps are based are

ACC NR: AP6001423

not equally detailed for all countries and natural regions. The study of the earth's vegetation cover is divided into 4 periods. The first period is largely based on Schroter's works and ends in 1910, the second period covers the years up to the Second World War, the third period covers the 1940's and 1950's. Vegetation cartography now is in its fourth period of development marked by more detailed small scale geobotanic maps of the continents composed with international cooperation. Geobotanical survey maps are gradually assuming greater importance in solving various economic and social problems. Orig. art. has: none.
