TITLE:

Multiplexing in a multi-channel radiotelemetering  
PPM-N system

PERIODICAL:

Archiwum Automatyki i Telemechaniki, v. 7, no. 3-4,  
679-687

TEXT: The authors consider the possibility of applying various types of commutators to a 32-channel PPM-N radiotelemetering transmitter and discuss trends in their improvement and modernization. Several solutions of multiplexing are discussed which are considered optimal from the point of view of economy, simplicity, reliability and their effect upon the system as a whole. From all possible versions of commutator arrangements only those are considered which can be realized with components available in Poland. Two types are shown to be preferable: systems in which the automatic calibration loop extends over the whole switching arrangement and, in the case of a single common modulator, systems in which the loop

\*Electrochemical Polarization of Metal Electrodes. II.- Polarization of the Zinc Electrode. W. A. Koepfer, E. S. Polupan, and W. A. Juszczyk. *J. Polon. Fiz. Nauk.*, 1939, **10**, (6), 515-528; *Chem. Zentr.*, 1940, **111**, (1b), 989. [In German.] The polarization of monocrystalline zinc was investigated oscillographically. The experimental oscillograms agree well with the results of the theoretical equation, taking into consideration the retardation of the discharge and the ionization processes. The magnitude as well as the activity of the surface changes with the polarization of the monocrystalline zinc. The velocity of the ionization and discharge processes on the electrode in equilibrium with the solution was found to be  $\sim 10^5$  cm.<sup>-1</sup> sec.<sup>-1</sup>.

TITLE: Changes in the antitoxin titer of animals used for serum production in the course of iodocasein feeding

SOURCE: Kiserletes Orvostudomany, v. 17, no. 2, 1965, 153-159

TOPIC TAGS: experiment animal, biochemistry, veterinary medicine, animal physiology, immunization, immunology

ABSTRACT: The changes in the antitoxin titer were studied in animals the metabolism of which has been increased by iodocasein feeding. Among horses immunized with diphtheria and tetanus toxin<sup>44,55</sup> and sheep immunized with staphylococcal toxin<sup>44,55</sup>, the antitoxin level of the groups fed on iodocasein was significantly higher than that of the controls. No noticeable difference was observed in cattle immunized with tetanus toxin. Orig. art. has: 1 figure and 5 tables. [JPRS]

"Clinical Findings of the Screening Tests on the Workers in the Production Collectives in Jaras Sellye - Dermatological"

Budapest, Orvosi Hetilap, Vol 104, No 19, 12 May 1963, pp. 873-875.

Abstract: Two thousand and sixteen of a total of 3896 individuals examined showed some kind of dermatological finding, although not all of these required medical treatment. The most frequent complaints included fungal diseases, pyoderma, seborrhea, eczema, precarc. carcinoma, allergenic effects, and changes due to advanced age. The dermatological condition of the Gipsy population showed a significant improvement, attributed to the Government's program providing permanent settlement facilities for the tribe. Only five instances of scabies were encountered; there was no evidence of pediculosis. One reference to a Hungarian publication.

**Abolition of pyloric spasm by orally administered procaine solutions.** G. Róka and L. G. Lajtha (Univ. Budapest). *Bud. Med. J.* 1950, 1, 1174-6. - Opening of the pyloric valve in humans was not affected by passage of 20 ml. of 0.1 N HCl or NaHCO<sub>3</sub> into the stomach. Subcutaneous injection of 1 mg. adrenaline always resulted, after 10-30 min., in the valve opening without difficulty, but never caused normal closure of pyloric spasm. Atropine 0.5 g. intravenously had no effect on the normal pylorus, but caused opening of the spastic pylorus. Papaverine up to 0.2-0.3 g. intramuscularly had very little effect on the normal pylorus, but usually opened the spastic pylorus. Oral administration of 100 ml. of 1% procaine soln. over 4-5 min. always opened spastic pylorus and kept it open for several hrs.

TITLE:

Study of ring copolymerization. I. Copolymerization of  
 $\alpha$ -piperidone with  $\epsilon$ -caprolactam

PERIODICAL:

Vysokomolekulyarnyye soyedineniya, v. 5, no. 2, 1963,  
206-211

TEXT: The possibility was studied of obtaining high-molecular fiber-forming polyamides on the basis of  $\alpha$ -piperidone by copolymerizing it with  $\epsilon$ -caprolactam (CL). Two techniques were applied: (1) Copolymerization at 40-45°C, 1-2 mm Hg, CL content 0-80%, and at 90°C with 90 and 100% CL; (2) in nitrogen atmosphere at 100, 120, and 160°C. The catalysts used were 2.5 mole% potassium and 1.2 mole% N-acetyl piperidone. Results with process (1): At 40-45°C, the polymerization time was 6 hrs, at 18-20°C 18 hrs, the yields (~ 60%) and m.p. of the polymers depended on the composition and were always higher than in the homopolymers. Mutual activation of piperidone and CL was observed. With equimolecular component

Card 1/3

S/190/63/005/002/006/024  
B101/B102

Study of ring copolymerization. . . .

ratio the m.p. decreased to ~0°C, so that copolymerization ensued at room temperature. The maximum yield was obtained with 40% piperidone and 60% CL. With equimolecular component, ratio the copolymer contained equally equimolecular parts of the components. Results in process (2): The yield increased with rising CL content.  $\alpha$ -piperidone in itself and its 80-90% mixture with CL could not be polymerized under these conditions. The m.p. of the copolymer increased with increasing CL content. The optimum yield, 97%, was obtained with 30% piperidone + 70% CL. The polymerization time was 4 hrs at 100°C, 2 hrs at 120°C, 1 hr at 160°C. The melting point increases with rising polymerization temperature and reaches 180-185°C. The molecular weight is not affected by varying the addition of potassium between 1 and 2.5 mole%, but it is reduced when the addition of N-acetyl piperidone is increased from 0.25 to 1 mole%. At ~195°C, a fiber was drawn from the copolymer melt having an intrinsic viscosity of 0.6, which had 400-500% elongation at room temperature. The increase in reactivity of the  $\alpha$ -piperidone in the presence of CL is due to thermodynamic and kinetic particularities of the process, which must be further investigated. There are 4 figures and 1 table. The most important English-language reference is: N. Joda, A. Mijake; J. Polymer Sci., 43, 117, 1960.

TITLE: Copolymerization of the lactam of hexahydro-p-amino-benzoic acid with epsilon-caprolactam and zeta-enantholactam

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 6, 1965, 1092-1097

TOPIC TAGS: copolymer, organic chemistry, polyamide, cyclic compound, catalyst

ABSTRACT: The authors report on copolymerization of the hexahydro-p-aminobenzolactam (I) with  $\epsilon$ -caprolactam (II) and  $\zeta$ -enantholactam (III) to produce polyamides of high molecular weight. This is another example of the copolymerization of cyclic compounds as reported by A. V. Volokhina, G. I. Kudryavtsev, N. V. Mikhaylov, and O. P. Rokachevskaya (Vysokomolek. soyed. 5, 206, 1963). Utilization of I in this synthesis is of practical interest, due to the ready availability of this lactam from benzoic acid and to the high thermal stability<sup>15</sup> of linear polyamides derived from bicyclic compounds. I (m.p. 192°C, from benzene-petroleum ether) was prepared according to G. Wendt (Chem. Ber. 75, 425, 1942), the only modification being the replacement of Pt catalyst by Rh, after A. A. Balandin

3

and M. L. Khidekel' (Dokl. AN SSSR, 123, 83, 1958). Technical II was purified by vacuum distillation. III was obtained by alkaline depolymerization of poly-enanthoamide after T. I. Sheyn and V. N. Topchibasheva (Khimich. volokna, 1959, No. 5, 21). Copolymerization was conducted in the presence of 2 mol % of K salt of II as a catalyst and 1 mol % of N-acetyl-II as co-catalyst. Effect of the molar ratio of I to II or III, of the reaction temperature, of amount of catalyst and co-catalyst upon the character and yield of the products was observed. It was found that: 1) in the presence of II or III the ability of I to polymerize increases rapidly, giving the desired fibrous polyamide of high m.p. in an almost quantitative yield; 2) the m.p.'s of the mixed polymers are functions of their composition, i.e., isomorphic substitution of the individual chains in mixed polyamides by either II or III. Orig. art. has: 3 graphs and 1 table.

TITLE: Ohmic and blocking contacts on semiconducting films on cadmium sulfide 21  
N. 44,55

SOURCE: Mezhvuzovskaya nauchno-tehnicheskaya konferentsiya po fizike poluprovodnikov (poverkhnostnyye i kontaktnyye yavleniya). Tomsk, 1962. 55 Poverkhnostnyye i kontaktnyye yavleniya v poluprovodnikakh (Surface and contact phenomena in semiconductors). Tomsk, Izd-vo Tomskogo univ., 1964, 254-261

TOPIC TAGS: cadmium sulfide, semiconducting film, photoconducting film, aluminum

ABSTRACT: Some of the photoelectric properties of cadmium sulfide films with blocking (Aquadag and copper) contacts are compared with these properties in films with ohmic contacts produced by vaporizing aluminum onto a surface treated in a glow discharge. Cadmium sulfide shows a slow increase in photocurrent after voltage application (under constant illumination). In films with Aquadag contacts, the photocurrent in a strongly illuminated specimen increases for hours, sometimes reaching values several times the original value. Ohmic aluminum contacts completely eliminate this phenomenon. When the voltage is switched on, the current in an illuminated film specimen with aluminum ohmic contacts reaches a stationary value

Card 1/3

L 00710-66

ACCESSION NR: AT5020471

in a shorter period than the time constant of the measuring instrument. In specimens with blocking contacts, a change in polarity of the applied voltage caused a drop in the photocurrent which was replaced by an increase after a certain time, usually measured in seconds. Rectification was usually observed with a "rectification constant" of 10-12. These effects completely disappeared with the substitution of ohmic contacts. Films with ohmic aluminum contacts have linear current-voltage characteristics (see fig. 1 of the Enclosure). It is shown that cadmium sulfide films obey Ohm's law at field strengths up to 100-150 v/cm. Ohmic contacts eliminate the ultralinearity in current-illuminance characteristics which occurs when blocking contacts are used. The aluminum ohmic contacts were found to be quite stable under severe heat conditions. These contacts were able to withstand protracted heating (several hours) in air or in a vacuum to 200-250°C, and short term heating to higher temperatures without losing their ohmic properties. TOPIC TAGS: photoconductor, photoeffect, cadmium sulfide, photosensitivity,  
germanium

ABSTRACT: The role of contacts in photorectification in cadmium sulfide films is  
investigated. The work was done to evaluate earlier explanations of this phenom-  
enon (S. M. Ryvkin and L. G. Paritskiy, ZhTF, XXIV, No. 1, p. 3, 1954; G.  
Wlerick, Ann. Physique, I, 623, 1956). Cadmium sulfide films of high photo-  
sensitivity with thicknesses of several tenths of a micron to a few microns—  
produced by vaporization in a vacuum on glass or ceramic—were subjected to par-  
tial illumination of constant intensity as well as to intermittent light with a  
frequency of 600 cps, where the illuminance was 100 lx and the width of the light  
Card 1/4

3

band was 0.07 mm. The distributions of potential, photo-emf, and photoresponse for a specimen of n-type Ge under intermittent partial illumination are shown in Fig. 1 on the Enclosure. It was shown that contacts can exert a substantial influence on the behavior of a photoconductor under partial illumination and that barrier contacts are responsible for photorectification in cadmium sulfide films. The authors thank L. I. Baranov for discussion and valuable advice. Orig. art. has: 4 graphs, 1 diagram, and 3 formulae.

TITLE: The effect of moisture on the conductivity of CdS films doped with CdCl<sub>2</sub> (brief communication)

SOURCE: Ukrayins'kyi fizychnyy zhurnal, v. 9, no. 3, 1964, 342-343

TOPIC TAGS: CdCl<sub>2</sub>-doped CdS, moisture sensitive CdS film, cadmium sulfide film, cadmium chloride doped, cadmium sulfide film

ABSTRACT: An attempt was made to explain the sensitivity of the electrical conductivity of CdCl<sub>2</sub>-doped CdS films to atmospheric moisture. The sensitivity, manifested as a sharp minimum in the conductivity between 60 and 70°C, is greatest for the largest doping concentrations, and is absent in lightly-doped samples. The effect is also absent in a vacuum. The conductivity of the heavily-doped samples decreases in a vacuum, and that of the lightly-doped samples increases. Two competing processes, the effect of moisture and the evolution of oxygen in the evacuated chamber occur. All of these factors lead the authors to the conclusion that the drop in conductivity of moisture-sensitive samples between 60 and 70°C is due to a "dessication" [drying-out] of the film (thickness about one micron). crystalline cadmium sulfide, CdS film, photosensitive film

ABSTRACT: Principles of the preparation of photoconductive poly-  
crystalline cadmium sulfide are discussed. Two methods for preparing  
photosensitive CdS films are presented: 1) Cadmium sulfide films  
were obtained by evaporating CdS in vacuum, adding CuCl<sub>2</sub> and NaCl to  
the initial powder, and heating the mixture in air. As substrate,  
15 mm x 15 mm polished glass was used. The thickness of the films  
was several microns. 2) Films having a large area (tens of cm<sup>2</sup>) were  
prepared by adding copper in the form of CuCl<sub>2</sub> and chlorine in the
