

ROSICKÝ JAN

✓ Coumarin derivatives. Jan Rosický and Karel Fučík.
 Czech: 84,516, July 1, 1956. By condensing benzotetronic
 acid (I) with alcoholates of aliphatic esters of OHCCO₂H
 (II) products showing anticoagulant activity are obtained.
 I (7 g.) in 780 ml. boiling water treated with 10.5 g. EtO-
 CH(OH)CO₂Et; the white pptd. intermediate product, m.
 172-4° filtered off; extd. with NaHCO₃ soln.; the ext.
 treated with C₂ pptd.; with HCl, and a ppt.; recrystd.
 from MeOH yields the tautomeric form of the Et ester of
 bis(4-hydroxycoumarin-3-yl)acetic acid, m. 153-4°. Czech.
 84,517. Condensation of benzotetronic acid (I) with ali-
 phatic esters of OHCCO₂H (II) gives compds. with anti-
 coagulant activity. I (7 g.) in 760 ml. boiling water treated
 with 7 g. OHCCO₂Et produces a white ppt. of the Et ester,
 m. 153-4° (from MeOH), of bis(4-hydroxycoumarin-3-yl)-
 acetic acid (III). Similarly, from 6.48 g. I and OHCCO₂R
 are obtained the following R esters of III (R, wt. (g.) OHC-
 CO₂R used, and m.p. of product given): Me, 2, 203°; Pr,
 2.8, 143-4°; iso-Pr, 2.6, 201°; Bu, 2.9, 154-6°; iso-Bu,
 2.9, 174°. Allyl ester of III, from 32.4 g. I with 11.5 OHC-
 CO₂CH₂CH=CH₂, m. 152°. Cf. Czech: 84,515 (C.A.
 50, 7146e). L. J. Urbánek

 Distribution of molecular weights of butadiene-styrene copolymers. Ladislav Rosk and Bernard Škrabal (VOSK, Gottwaldov, Czech). *Chem. průmysl* 9, 377-81 (1969).
 The influence of Diproxide (I) on the mol. wt. distribution in the course of emulsion copolymerization of butadiene with styrene was studied at 0-0.4% I. After 60% conversion the emulsion was stabilized with phenyl-2-naphthylamine (II). For fractionations the copolymer was coagulated with iso-PrOH, washed with MeOH + 0.5% II, and dissolved in toluene or CHCl₃. To the resulting 0.5% soln. of the copolymer the iso-PrOH was added dropwise at 30°, and when the coagulation point was reached, the azeotropic mixt. iso-PrOH + toluene or CHCl₃ was removed at lowered pressure till the desired turbidity appeared, the latter being removed by raising the temp. (32-6°), and then the soln. being cooled slowly to 30°; in this way 9-14 fractions were obtained. The isolated fraction was dissolved in toluene, and after evapn. of iso-PrOH + CHCl₃ at 40°/vacuum, the intrinsic viscosity ($[\eta]$) was detd.; the 1st fractions of copolymer prepd. with 0.02% I always contg. some microgel. The Defo-plasticity and $[\eta]$ of copolymer decrease with increasing I. At low concns. of I (<0.02%) the distribution is very broad, fractions of $[\eta]$ <1 being absent; with increasing amts. of I (up to 0.3%) the distribution becomes narrower, the processibility better, but the mech. properties decrease. By using the apparent transfer const. (c') the values of \bar{M}_n , \bar{M}_w and the theoretical distributions were calcd.; from a log plot the consts. in $[\eta] = KM^\alpha$ were found for copolymer prepd. with 0.1 and 0.3% I, resp. ($K = 1.72$ (3.09 resp.) $\times 10^{-4}$; $\alpha = 0.74$, 0.75 resp.), the exptl. estd. distribution being in good agreement with the calcd. one. If c' , conversion, and concn. of I are known, the distribution can be calcd. J. Šebenda

trifluorethylene were used. In order to be able to carry out tests at various temperatures a simple thermostat was used. From the difference between the initial and the remaining charge and the elapsed time the velocity of the charge losses or the current loss was determined. The modification of the potential of the measuring electrode on the occasion of irradiation by β particles is due to the absorption of these particles in the measuring electrode and in the insulator, as well as by the latter's conductivity. Results showed that the surface losses and the spatial conductivity of the materials investigated cause a considerably smaller change of the potential of the measuring electrode of the chamber than the absorption of the β particles. The velocity of voltage modification differed according to whether the measuring electrode has a positive or negative initial charge. All measurements were registered in a table and mentioned within the framework of this work. The condenser chamber method was proved to be serviceable. The conductivity of all materials examined was found to be several degrees lower when irradiated than the corresponding air volume. The following materials were found to have the lowest degree of spatial conductivity during irradiation and while the insulating surface was screened off: polymethylmethacrylate, pressed amber, and polychlorinetrifluorethylene. The temperature coefficients of the conductivity of the organic insulators are very high. For irradiated samples they are even higher.

Rosenfeld, B. A. Die metrische Geometrien des Kugelraumes. Uchenye Zapiski Moskov. Ges. Univ. Matematika 73: 59-82 (1944). (Russian. German summary) [MF 15195]

The totality of spheres of a 3-space of constant positive curvature is mapped following Lie (who, however, considered a flat 3-space) on a four-dimensional quadric L of a projective 5-space. Lie himself considered the geometry of L corresponding to a 15-parameter group of projective

as L invariant; in terms of the spheres of the original 3-space one may say that the group transforms spheres of a certain radius into spheres of the same radius. Two of these groups have been considered before (or rather analogous groups corresponding to spheres in flat space): one by Möbius and the other by Laguerre; they leave invariant spheres of radius zero and $\pi/2$, respectively. A third group of rigid transformations which the author singles out for special consideration leaves invariant autopolar spheres (spheres of radius $\pi/4$); this group has no counterpart in the case of

Rosenfeld, B. Theory of surfaces in symmetrical spaces.

Bull. Acad. Sci. URSS. Sér. Math. [Izvestia Akad. Nauk SSSR] 9, 371-386 (1945). (Russian. English summary)

In earlier papers the author had considered the representations of m -parameter varieties consisting of configurations of a Euclidean space (for instance, the totality of spheres) as an m -dimensional surface in a space of sufficiently high dimension. Here a general theory is given in which a variety M with a transitive Lie group \mathcal{G} is imbedded into a Euclidean or pseudo-Euclidean space E . If every transformation of \mathcal{G} may be continued into a rotation of E the author says that we have a "one-sided" representation of M as a "surface". If \mathcal{G} does not have such a rotation of E which

takes M into itself induces in M a transformation of the group \mathcal{G} he speaks of a "two-sided" representation. The greater part of the paper is devoted to the case when M is symmetric in the sense of É. Cartan, and is based on a series of Cartan's papers.

In general, if the group is compact the imbedding space is Euclidean and if the group is noncompact (in this case it is necessary to assume that it is linearly representable) E is pseudo-Euclidean (has an indefinite metric). We have a two-sided representation when the group is semisimple, and if that is not the case the representation is one-sided. The method, in general, consists in introducing into the algebra representing the group \mathcal{G} of a Euclidean or pseudo-Euclidean metric. The author considers, in particular, the representation of the orthogonal group in the algebra of real matrices, the unimodular unitary group in the algebra of complex matrices and the spinor group in the algebra of Clifford numbers. The geometrical examples include the set of m planes through a point of Euclidean or pseudo-Euclidean n -space, m -dimensional spheres of n -space, hyperquadrics of projective n -space. In the last section homogeneous non-symmetric spaces are briefly considered, such as the variety

Rosenfeld, B.

Rosenfeld, B. Géométrie différentielle des familles de plans à plusieurs dimensions. Bull. Acad. Sci. URSS. Sér. Math. [Izvestia Akad. Nauk SSSR] 11, 283-308 (1947). (Russian. French summary)

The author studies the geometry of m -dimensional planes in Euclidean n -space by means of normalized Grassmann coordinates. These coordinates may be regarded as the components of a vector p in a space R_n^m of $\binom{n}{m}$ dimensions. Introducing Cartan's affine connection, the geodesics are m -helicoids, i.e., m -planes having the same perpendicular and the same 2-planes containing stationary angles, while the distance from $p(t)$ to $p(0)$ is $p \cdot t$ and the angles are $\omega_n = k_n \cdot t$ ($k_1^2 + \dots + k_m^2 = 1$). A linear element is introduced in R_n^m by means of the tangent m -helicoid. The author then studies k -parameter families of m planes: surfaces ($k < n - m$), congruences ($k = n - m$) and complexes ($k > n - m$). This work generalizes that of Segre, Kummer and others for special values of k, m and n .

[Sulphur dioxide as a] cathodic depolariser. I. L. Rosenfeld and
T. T. Lukonina (*Dokl. Akad. Nauk SSSR*, 1956, **111**, 136-139).
Curves are produced of the cathodic polarization of Cu, Al and Fe
in thin layers of 0.1 N-aq. Na₂SO₄ in pure air and in air
containing 0.1-1.0% of SO₂. With the addition of SO₂ to the
atm., the c.d. increases sharply. It is concluded that the effectivity
of various metals as cathodes increases in the presence of SO₂ and
in these conditions depolarization of the cathode occurs basically
due to the reducing action of SO₂. Thus copper in the presence
of this gas can strongly increase the corrosion of metals in contact
with it and also be corroded itself. Because SO₂ is readily sol. in
electrolytes, even with small quantities in the atm., its action can
become comparable with that of oxygen.

The corrosion current of elements in thin layers of electrolyte (70 to 165 μ) is determined by the rate of the cathode process. The over-all corrosion current in thin layers is less than during complete immersion of the element in the solution, but the current density at the site of contact of the electrodes is higher for films than bulk solutions.

Influence of the p_{H} of a Solution on the Corrosion and Electrode Potential of Copper. G. V. Akimov and I. Ia. Rosenfeld (*Zhur. Fizich. Khimii* [J. Appl. Chem.], 1940, 14, 1190-1191; *Russ. Chem. Rev.*, 1942, 11(1), 64). (In Russian.) In aqueous solutions of varied p_{H} (HCl and NaOH, with and without 0.01N NaCl), the electrode potential of copper is displaced toward positive values with decrease of p_{H} between 3 and 0. This can be explained by: (1) high concentration of Cl^- ion, (2) destruction of the protective film of Cu_2O by the Cl^- ion, and (3) the possible formation of simple and complex compounds, the latter causing also considerable corrosion of the copper. In the range p_{H} 3-10, copper has a more positive electrode potential, and undergoes insignificant corrosion, owing to the stability of the protective film and the formation of electrodes of the second kind. In the range p_{H} 10-14, the potential is again displaced towards negative values, and corrosion increases as the result of solution of the protective film with formation of the cuprites Na_2CuO_2 and NaHCuO_2 . The maximum of the potential p_{H} curve does not coincide with that of corrosion p_{H} curve.

TITLE: Method of protecting metals from atmospheric corrosion

PERIODICAL: Byulleten' izobreteniy, no. 18, 1961, 54

TEXT: Class 48d, 5. No. 141362 (661878/23 of April 7, 1960). A method of protecting metals from atmospheric corrosion with the aid of volatile inhibitors - amine salts in combination with nitrobenzoic acids, the distinctive feature of which consists in that, for the purpose of protecting non-ferrous metals, one uses salts of hexamethylenamine in combination with an orthonitrobenzoic acid, or 3.5-dinitrobenzoic acid.

On the Scattering of Fast Particles by Nuclei.

The Scattering of Myons into Large Angles. The first experiments carried out with respect to the scattering of myons resulted in a cross section for large scattering angles which was of abnormal size. This phenomenon was carefully studied at Manchester for a further energy domain of myons, this was done with the aid of a Wilson chamber into which leaflets of lead and iron were introduced. The mesons observed could be subdivided according to their energy only into separate groups with broad spectral distribution. For each of these groups the distribution was determined from a rather small number of observed phenomena, so that the uncertainty of these measurements must be considered to be rather great already for purely statistical reasons. Experimental data are compared with the theory of manifold scattering. For iron selection of the various theoretical curves is rather difficult. Data for lead show a certain prevalence of scattering into large angles. Various causes may be responsible for the abnormality of scattering.

The Scattering of Fast Neutrons by α -Particles is of special significance because it is of sufficient simplicity for the accurate investigation of the interaction if certain suggested laws of interaction among nucleons are assumed. Among other things, experiments concerning the scattering of fast neutrons show that the effective "nuclear radius" for this process has the form $R = r_0 A^{1/3} + a$.

ROSENFELD, L.

Rosenfeld, L. On the foundations of statistical thermodynamics. Acta Phys. Polon. 14 (1955), 3-39. (Russian summary)

The author gives an excellent analysis of our present state of knowledge and understanding concerning the foundations of statistical mechanics and the statistical interpretation of thermodynamics. The emphasis lies on the sort of complementarity existing between the aims of a thermodynamical description and a microscopic description of systems with many degrees of freedom. The analogy as well as the differences with the quantum-mechanical measuring process are stressed. The technical discussion starts with isolated systems and describes the classical and quantummechanical ergodic theorems. The statistics of non-isolated systems is then derived from the case of isolated ones. The statistical foundation of thermodynamics is finally discussed.

"The Role of the Spleen in Calcium Metabolism."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, p 124

Abstract: Splenectomy and experimental splenomegaly reduce the resistance of rats to the toxic effect of Na oxalate, that is, they reduce the amount of Ca that can be released from the organism. Splenectomy increases the extent of skin calcifications, methylcellulose splenomegaly reduces it. The spleen regulates Ca metabolism indirectly by its homeostatic effect on the metabolism of steroids. 1 Figure, 1 Czech reference. Submitted at "16 Days of Physiology" at Kosice, 28 Sep 65.

TITLE: Some Peculiarities of the Centrifugal Casting Cry-
stallization Processes

PERIODICAL: Liteynoye Proizvodstvo, 1959, Nr 6, pp 40-41 (USSR)

ABSTRACT: During recent years, in the practice of centrifugal
casting, shapes have been produced from alloys which
render the crystallization and the technology more dif-
ficult, like e.g. castings of steel ShKh 15, austenite
steel, large hollow castings from copper alloys, tin
bronze, etc. This practice has contradicted the hither-
to simplification of the theory of crystallization and
demands a more profound study of the process of cry-
stallization. The author refers to several Soviet au-
thors, who published papers on the formation of crys-
tals and their speed. When pouring cylindrical shapes
from alloys (e.g. tin bronze or carbon steel) a new
structure of crystals is formed, described too by

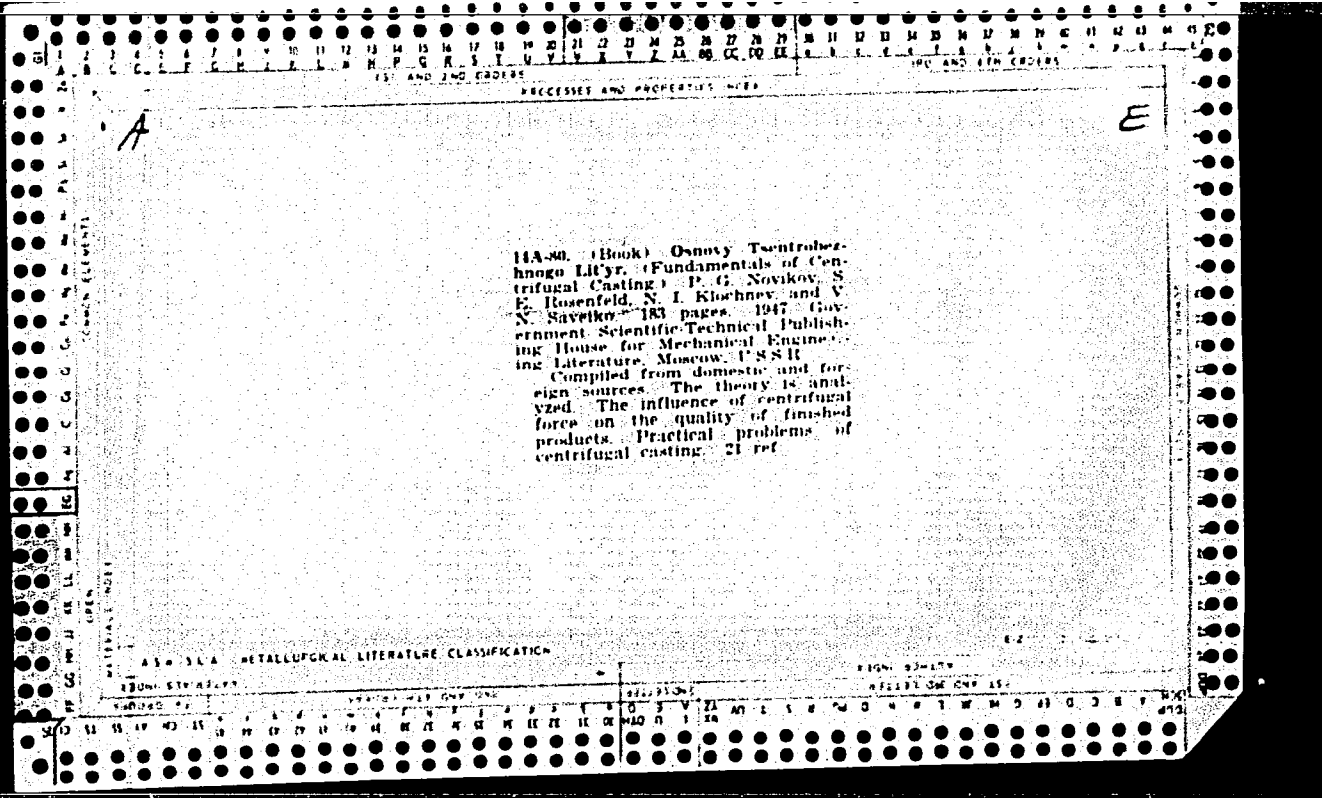

Card 1/2

SOV/128-59-6-14/25

Some Peculiarities of the Centrifugal Casting Crystallization Processes

L. Northcott and M. Leon ("Steel", Nr 17, April 1946). This structure of crystallization is to be explained by the non-uniform composition and the mechanical properties of the metal and leads to a diminution of the durability of the casting. Only for cast iron, this streak type crystallization does not play any role. The opinions on the formation of this type of crystals are different. Several authors take view that they are a result of the vibration. This standpoint is unfounded, as this type of crystallization is formed without vibration too. Several theories could not be confirmed too by the experiments made. Likewise the comprehension backed by several scientists on the effect of certain crystallization forces are found not correct by the author. Even for the crystallization of tin the formation of the crystals is more or less dependent from the percentage of the tin contents than from the crystallization forces. There are 3 diagrams and 11 references, 9 of which are Soviet and 2 English

The Development of Methods of Chill and Pressure Die Casting. N. F. Rosenfeld, (Vestnik Metallopromyshlennosti, 1940, No. 7, pp. 49-54). (In Russian). Factors affecting the choice of chill casting or pressure die casting are discussed. Pressure die casting of ferrous metals in Russia is in the experimental stage. In the machine described, the metal is melted by heat generated by the passage of an electric current through the enclosed graphite crucible containing the metal. Injection into the die is done by compressed air through an opening in the bottom of the crucible opened and closed by a needle valve.

TITLE: Aleksandr Dmitriyevich Stepanov on his 60th birthday

SOURCE: Elektrichestvo, no. 9, 1964, 93

TOPIC TAGS: electric engineering personnel

ABSTRACT: A. D. Stepanov, Professor in the Department of "Electrical Transportation" of the Moscow Power Engineering Institute and prominent specialist in the field of diesel and gas turbine transportation, had his sixtieth birthday this year. His interest for the past 35 years has been in the field of automation of transportation equipment. Among the great number of printed works by Professor Stepanov, his books "Diesel-electric Drive for Transportation Equipment" and "Ways for Increasing the Efficiency of Diesels and Gas Turbine Locomotives" deserve special attention along with a number of books on diesels written by him in co-authorship with workers in industry and transport. He has just published a new book, "Automatic Power Control of Diesel and Gas-Turbine Locomotives."

1309. THE INFLUENCE OF THE NERVOUS SYSTEM ON THE TROPHIC STATE OF BONE - Rosenfeldová A, and Rosenfeld R. Inst. of Physiol., Med. Fac., Palacky Univ., Olomouc - *PHYSIOL. BOHEM.* 1958, 7:1 (73-79) Tables 2

Following denervation of the hind limb in rats there is a decrease in weight of the denervated tibiafibula which is in direct relationship to the time elapsed after the denervation. Statistically significant smaller changes in weight of the denervated tibiafibula were noted in rats after parathyroidectomy than in rats with the parathyroids intact at the same time intervals after denervation. In rats in which experimental hyperparathyroidism had been evoked by impairing kidney function by uranylacetate, the decrease in the weight of the denervated bone was statistically significantly greater than in rats with normal parathyroid glands.

"Influence of Sex Glands on the Regulation of Calcium Metabolism."
Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, p 123

Abstract: Administration of androgen or estrogens substantially increases the toxicity of sodium oxalate for mice and rats. The amount of Ca that can be released is reduced by administration of sex hormones because they cause increased Ca fixation in bone tissue. They act in 90 to 150 minutes, which is faster than the anabolic effect of these hormones on protein metabolism. Estrogen reduces the amount of skin calcification, castration increases it. 1 Figure, 2 Czech references. Submitted at "16 Days of Physiology" at Kosice, 28 Sep 65.

"The Role of the Spleen in Calcium Metabolism."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, p 124

Abstract: Splenectomy and experimental splenomegaly reduce the resistance of rats to the toxic effect of Na oxalate, that is, they reduce the amount of Ca that can be released from the organism. Splenectomy increases the extent of skin calcifications, methylcellulose splenomegaly reduces it. The spleen regulates Ca metabolism indirectly by its homeostatic effect on the metabolism of steroids. 1 Figure, 1 Czech reference. Submitted at "16 Days of Physiology" at Kosice, 28 Sep 65.

Selective absorption of neutrons. I. Kara, I., Rosen-lyrikh, K. D. Sinelnikov and A. Val'ter. *Physik. Z. Sowjetunion* 8, 219-22(1935); cf. preceding abstr.— Since Fe and Cu absorb slow neutrons much less than neutrons with medium velocities, the problem of selective absorption was investigated. Ra with Be was used as a source, and slow neutrons with different velocities were obtained by dissolving boric acid in water. A table and a graph show the results. Apparently the av. values of the sensitivity for B, Ag and Cu lie consecutively one above the other, B being the lowest. The optimum absorption value for B is probably very near to the zero velocity of neutrons, and the max. for Ag may be near zero also. The effective cross-section for absorption decreases rapidly with increasing velocity of the neutrons, which is to be expected on theoretical grounds.

TITLE: A method of manufacture synthetic resin flake. CZ Pat. No. PV 1607-65,
Class 39

SOURCE: Vynalezky, no. 12, 1965, 16

TOPIC TAGS: resin, synthetic resin, resin flake

ABSTRACT: A method has been introduced for manufacturing flaked synthetic resins from resin melts containing suitable solvents. The adjustment of the growth of the molecules is achieved by lowering the ratio of the solvent to unreacted components, and by a secondary reaction at reduced pressure at temperatures ranging from 70 to 200C, with best results in the 120-150C range. The resin melt obtained by this process, still hot, is then continuously fed into a roller mill, with two rollers revolving in opposite direction, whereby the resin film formed on the roller as a result of cooling is being scraped off by cutting knives mounted on the stand. By appropriate:

Card 1/2

L 47087-66

ACC NR: AP6017897

adjustment of the roller temperature and by regulating their speed, the resin film solidifies before reaching the blades to such a degree that when being cut off the roller, the film breaks into flakes of the desired shape. One point of the patent is itemized. [KP]

before the varnish is placed on it, 2) cracks appearing after the varnish has been placed, due to stresses in the specimen. Micro-cracks 1/10 microns wide (cracks due to stresses can be determined from a width of 1μ). The method makes it possible to test specimens loaded statically or dynamically. For static loads an indicator and a switch for a determined number of ribbons are used. In the case of dynamical loading a device is connected which records the number of cycles of loading from the beginning of measurement up to the appearance of a crack.
