E073/E535**AUTHORS:** Shatolova, V.I. and Khitrov, V. A.**TITLE:** On the influence of the temperature on the resistance to corrosion and the electrode potentials of metals in acidic media. I. Iron.**PERIODICAL:** Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1961, Vol.4, No.3, pp.404-408**TEXT:** The authors carried out systematic investigations on the influence of the temperature on the resistance to corrosion and the electrode potentials of Armco iron (C 0.028%, Si 0.14%, P 0.11%, Mn 0.15%, S 0.01%) in solutions of sulphuric and hydrochloric acid. Specimens 22 x 20 x 2 mm were investigated. These were rubbed down with emery paper of varying coarseness, degreased in a hot 10% alkali solution, washed in water, dried in alcohol, ether and were then weighed. The quantity of electrolyte used was 150 ml; the temperature was maintained by means of a water thermostat, with an accuracy of  $\pm 0.1^{\circ}\text{C}$ . The investigations were carried out simultaneously on at least ten specimens in the

temperature range 0 to 80°C with temperature steps of 20°C. For the electrochemical investigations 10 x 10 mm electrodes were used, which were cladded with polystyrene in such a way that only one surface was actively in operation. The surface preparation was the same as for the weight tests. The potentials were measured by means of a potentiometer, using a compensation method. The potential was determined relative to a hydrogen electrode, using as an electrolyte an acid of 1 N. The measurements were made in an electrolyte which was still, in the presence of air. The curves of cathode and anode polarizations were recorded simultaneously, the anode and cathode spaces being sub-divided by a glass filter. D.C. from anode batteries was used for polarization, the density of the polarization current varied between  $10^{-2}$  and  $10^{-6} \text{ A/cm}^2$ . The current was measured by a millivoltmeter; the entire instrument was thermostated. It was found that the speed of corrosion of Armco iron increases continuously with temperature, both in the sulphuric acid as well as in the hydrochloric acid. At 20 to 25°C corrosion is more intensive in sulphuric acid, whilst at higher temperatures corrosion is more intensive in the hydrochloric acid.

On the influence of the ...

Fig.1 shows the dependence of the logarithm of the corrosion speed of Armco iron on the reciprocal of the absolute temperature; 1 - in 1 N  $H_2SO_4$ , 2 - in 1 N HCl. The temperature coefficients of the corrosion decreased with increasing temperature. This was to be expected since, according to the Arrhenius equation, these decrease with increasing temperature. It was found that on the whole the speed of corrosion of Armco iron obeys the Arrhenius equation in the investigated temperature range. The values of the temperature coefficients, which are tabulated, allow the conclusion that the speed of corrosion of iron is governed by the speed of the chemical reaction. The electrode potentials were also investigated. Fig.2 gives the dependence of the electrode potential (normal hydrogen equivalent) on time (min) at various temperatures (a - 1 N solution of  $H_2SO_4$ , 6 - in 1 N solution of HCl). Fig.3 gives the influence of the temperature on the steady state potential of Armco iron: 1 - in 1 N solution of  $H_2SO_4$ , 2 - in 1 N solution of HCl. Fig.4 gives the cathode and anode polarization in the temperature range 0 to 80°C (a - in a 1 N solution of  $H_2SO_4$ , 6 - in a 1 N solution of HCl). The following conclusions are arrived at:

On the influence of the ...

27392  
S/153/61/004/003/002/008  
E073/E535

1. Increase of the temperature of 1 N solutions of sulphuric acid and hydrochloric acid is accompanied by an increase in the corrosion speed of Armco iron which is fully in accordance with the Arrhenius equation; the process is governed by the speed of the chemical reaction.
2. An increase in the temperature leads to a shift in the potentials of the Armco iron in both acids towards negative values. A slight smoothing out of the potentials at elevated temperatures is explained by an intensification of the effect of corrosion on the surface of the metal and by baring of cathode inclusions.
3. An increase in the temperature facilitates both electrode processes to approximately the same extent.

TITLE: A Track-Laying Machine for the Construction of Narrow Gage Railways for Timber Transportation (Puteukladchik dlya stroitel'stva uzkokoleynykh lesovoznykh zheleznykh dorog)

PERIODICAL: Mekhanizatsiya trudoyemkikh i tyazhelykh rabot, 1958, Nr 2, pp 14-16 (USSR)

ABSTRACT: At the suggestion of the head of the Pizhma narrow gage railway of the Gorkles Trust, N.M. Sintsov, a track-laying machine for the construction of narrow gage railways was built. It is mounted on a narrow gage Diesel locomotive of MUZ-4 type. A 5 m long double cantilever is fixed on the roof of the locomotive with a grapple suspended on one end and activated by winches installed on the locomotive. Sections of track are loaded on two trailing flatcars. When the locomotive reaches the end of the already laid track, the grapple is placed above the middle of each track section on the following flat car, and grips this section and lifts it with the help of winches. This section is then guided to its position on the road bed. The workers then connect it with the preceding section and fix the bolts. The locomotive

Card 1/2

SOV/118-58-2-5/19

A Track-Laying Machine for the Construction of Narrow Gage Railways for  
Timber Transportation

moves forward again and the operation starts again. The same machine can also remove the old track by reversing the operations. It can also uproot tree stumps obstructing its way with the help of additional winches installed for this purpose on the locomotive. Though this machine is not perfect, it accelerates the track-laying operations. There are 2 photos and 2 diagrams.

TITLE: Mechanical Examinations of Welded Joints

PERIODICAL: Tr. Ural'skogo politekhn. in-ta, 1959, no. 80, pp. 179-182

TEXT: The authors point out that it is not allowable to judge on the supporting power of a welded joint from the tensile strength of its weakest zone, because the development of elastic and plastic deformations will be different for different correlations of the mechanical characteristics of the metal in the individual zones of the welded joint. Since the conditions of plastic deformation development show considerable effect upon the supporting power of the welded joint as a whole, the authors propose to revise the specimen shape and the test methods of welded joints for determining the yield point and the specific elongation, which can not be obtained by tensile tests of welded joints according to the standard GOST 6996-54 (GOST 6996-54). The proposal presented is corroborated by the exam-

SOURCE: Geliotekhnika, no. 5, 1965, 5-10

TOPIC TAGS: photoelectric detection equipment, actinometry

ABSTRACT: A combined two-mirror heliostat-containing solar stand was constructed in 1961-1962 at the testing area of the ENIN. The paper gives a detailed engineering description of the stand as a whole and of its various components (the mirrors, heliostat, reducing gears, photoelectric tracking sensors, vacuum system, and actinometric mechanism). The stand is presently in satisfactory operation. [The specific uses and results are not given.] Orig. art. has: 7 figures. [JPRS]

TITLE: Improving the technology of production of electromolten, zirconium-containing, refractory materials for glass furnaces

CITED SOURCE: Steklo. Inform. materialy\* Gos. n.-i. in-ta stekla, no. 2 (119), 1963, 55-62

TOPIC TAGS: glass manufacture, glass furnace construction, glass furnace material, refractory material, zirconium containing refractory material, arc furnace

ABSTRACT: In order to raise the output, improve the quality of the melt and effect a more economical utilization of heat in the process of melting high-stability refractory materials, a three-phase arc furnace has been installed in the testing facility of the Saratovskiy zavod tekhnicheskogo stekla (Saratov technical glass works). The electrical specifications of the furnace are given. Under the operating conditions indicated, the melt output of the 500 kg furnace is 300 kg/hr.

Bakor 33 was molten in the three-phase arc furnace and pieces were cast in the

form of 600 x 400 x 250 mm standard wall bars as well as draw plates and profile parts for burner ducts of glass furnaces (arch stones, "teeth" and "heels"). The average chemical composition and physical properties are given for bakor 33 glass bars whose characteristics are superior to those of bars made by the Yerevan works and not inferior to the best modern, foreign, fused refractory material, "Korkhart TsAK". Thus, in some tests, the glass strength of bakor 33 samples exceeded that of the "Korkhart TsAK" material and was higher than that of the bakor 33 and bakor 20 produced at the Yerevan works.

AUTHOR: Shatrov D.N.  
TITLE: Demonstration of Electric Resonance  
PERIODICAL: Fizika v shkole, 1959, Nr 3, pp 71-72 (USSR)  
ABSTRACT: The author recommends an obvious system of demonstrating electric resonance in physics classes. On the demonstration table, a circuit is assembled consisting of transformer T (see diagram) for reducing the alternating current from 220 to 120 volts, choke  $L_2$ , a 4 microfarad paper capacitative C and a 100 watt bulb of incandescence L for 220 volts. After connecting the transformer to the mains, the inductance of the choke diminishes by lateral displacement of the interchangeable part of the core. The students observe that, at a certain position of this part of the core, the incandescence of the bulb filament reaches a maximum, but diminishes at its further displacement.

Card 1/2

SGV/47-59-3-20/53

Demonstration of Electric Resonance

The incandescence becomes weaker if the coil is entirely removed. If the teacher, by moving the interchangeable part of the core, gradually increases the inductance of the choke, then the incandescence of the filament again reaches a maximum and will afterwards diminish. The author goes still further into details using the Thomson formula. In the beginning of the article he criticizes the demonstrational experiment described in "Kurs fiziki" ("Course of Physics") by A.V. Feryshkin (part III, paragraph 115) as inadequate. There is 1 circuit diagram.

USSR/Medicine - Typhus

"The Problem of Recurrent Exanthematous Typhus," I. I. Shatrov

Zhur Mikro, Epid, i Immun, No 6, pp 63-68

The incidence of primary epidemic typhus has decreased, but the relative wt of fairly well authenticated recurrent typhus has grown. The assumptions of endemic rat rickettsiosis or retention and reactivation of the causative factor in the body must be rejected as explanations for recurrent typhus. Although pediculosis was rare in the cases treated, occasional exposure to infected lice may be assumed. 64.2-65.5% of recurrent typhus patients had contact with travelers or handled soiled personal objects (laundry, clothing, etc.) Loss of immunity and renewed infection with epidemic typhus are probable.

Author : Shatrov, I. I.

Title : The problem of secondary exanthematous typhus

Periodical : Zhur. mikro. epid. i immun. 7, 19-24, Jul 1954

Abstract : The etiology, epidemiology, and incidence by profession of secondary exanthematous typhus [Brill's disease] in Moscow is discussed. Data obtained in investigations at two Moscow hospitals show that primary and secondary exanthematous typhus have the same etiology, and that secondary typhus is not a relapse, as has been claimed by other workers in this field. The results of the investigations of the incidence by occupation are presented on a chart. No references are cited.

TITLE: The Biological Properties of Shigella Dysenteriae, Isolated From  
Different Clinical Forms of Dysentery. Author's Summary.

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960, Nr 3,  
pp 128 (USSR)

ABSTRACT: The authors made a study of various strains of Shig. dysenteriae  
isolated from patients with different clinical forms of dysentery, ✓  
checking the strain's ability to cause experimental keratocon-  
junctivitis in guinea pigs, its virulence for mice and its sensitivity  
to antibiotics. No essential differences were found between the strains,  
which bears out the great part played by the state of the macroorganism  
in determining the nature of the clinical course in dysentery.

ABSTRACT: Trade School Nr 24 in Gor'kiy trains ship machinists, ship engineers, mates for lake and river navigation and machinists for steam cranes. Its teachers are highly qualified and a number of its foremen now participate in a correspondence course of the Gor'kiy Institute for ship engineers. The trade school faculty members work also in close contact with the Institute. As a result, the Institute instructors S. A. Ikonikov, V.N. Markov, N.G. Shutov, V. N. Mal'tsev and others lecture systematically at the school on such subjects as "New Technology on River Transport and Advanced Work Methods". At the Materials Testing Laboratory the school students are executing practical work dealing with general technology of materials. The students finish their practical training on board of ships. The article contains 2 photos.

TITLE: A device for measuring the total pressure in the face sections of a gas mask.  
Class 42, No. 181359 [announced by the Military Academy of Chemical Protection  
(Voyennaya akademiya khimicheskoy zashchity)]

SOURCE: Izobreteniya, promyshlennyye obraztsey, tovarnyye znaki, no. 9, 1966, 97

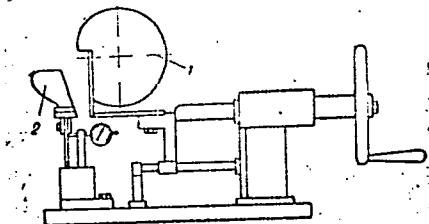

TOPIC TAGS: gas mask, pressure measurement

ABSTRACT: This Author's Certificate introduces a device for measuring the total pressure in the face sections of a gas mask. The unit contains a base and a sectional model of a head which is divided along the cross section. One of the parts of this model is fastened to a dynamometric spring element and connected to a force measuring mechanism, while the other is mounted on a feed mechanism. Measurement accuracy is improved by making the model in the form of two spherical sections with different diameters and a flat base at the point of junction.
