TITLE: Analysis of the Parameters of the Elastic Element in a Broad-band Vibro Pickup (Raschet parametrov uprugogo elementa shirokodiapazonnogo vibroshchupa)

PERIODICAL: V sb.: Tsentr. n.-i. in-ta tekhnol. i mashinostr., 1954, Nr 68, pp 11-22

ABSTRACT: The authors investigate a capacitive vibro pickup designed to measure vibrations within the 50 - 1,500 cps frequency range and 3 - 500 μ amplitude range. The pickup converts mechanical vibrations into capacitance variations which are then transmitted through an amplifier to a needle indicator. To assure that the vibration recordings yielded by vibro pickups will be absolutely continuous and complete, unmarred by sporadic breaks or interruptions, the vibration frequencies of the specimens or machine parts being tested should not be permitted to approach their critical values. Naturally, the basic-mode and overtone resonance frequencies must lie outside the range of the operating frequencies. The authors evolve a parametric criterion for the

SOV/124-57-5-6243

Analysis of the Parameters of the Elastic Element in a Broad-band Vibro Pickup

fulfillment of that requirement and propose alterations in the design of the elastic element in vibro pickups. The factor of secondary resonances was obviated in the experiments by employing an elastic element consisting of a system of two variable-width flat springs, each spring rigidly constrained at one end and subjected to a movable constraint at the other end. At frequencies of 1,500 cps, however, it was found that a vibro pickup cannot always be fully relied upon to turn out a vibration recording that is absolutely continuous, i. e., completely free of sporadic breaks or interruptions.

TITLE: Trial application of the induced polarization and the phase-amplitude measurement methods of electrical prospecting

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 3, 1962, 25, abstract 3A209 (Byul. nauchno-tekh. inform M-vo geol. i okhrany nedr SSSR, no. 4 (32), 1961, 26-34) ✓

TEXT: The methods of induced polarization and phase-amplitude measurement give good results for deposits of impregnation ores; here, in addition to prospecting for mineralized zones by induced polarization methods, it is possible to detail the structure of ore zones, appraise their depositional features, and estimate the approximate concentration of sulfides. Multifrequency techniques -- the double-loop method and the method of dipole induction magnetic profiling -- are being put into practice. The application of these methods per-

TITLE: Use of the frequency characteristic of anomalies in direct-current electrical prospecting

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 3, 1962, 25, abstract 3A214 (Byul. nauchno-tekh. inform. M-vo geol. i okhrany nedor SSSR, no. 4 (21), 1959, 32-35)

TEXT: A method is described for dividing anomalies, brought about in induction method-work by orebodies with a differing conductivity, according to the character of the change in the amplitude values and in the initial phases of the field components at different frequencies. Equipment consisting of two reception loops, 10 m apart from each other, and a phase-amplitude compensator, was used in the field work. The receiving loops were disposed horizontally. The amplitude ratio and the phase difference, corresponding to the magnetic vector components H_{1z} and H_{2z} , were measured at points ✓

Card 1/2

Use of the frequency ...

D228/D301

10 m apart from each other. Examples are shown for an anomaly, caused by a massive orebody, and one due to graphite schist with an elevated electrical conductivity. These anomalies differ considerably from each other according to the character of the amplitude and phase changes at frequencies of 125, 1250, and 6250 c/s. ✓ Abstracter's note: Complete translation.

SHLYNKOV, JU.
GEO. ✓ Geological particularities of ultrabasic and ultra-alkaline
magmatic formations in platforms. Yu. M. Sheinmann,
All-Union Aerogeol. Trust Moscow), *Zapiski Vsesoyuz.*
Minerolog. Obschchestva 84, 143-54 (1955).—Ultrabasic eruptives, characterized by a high R₂O and CaO content, are usually only observed in formations after an older volcanism with augitic-limburgitic-picritic intrusions which are nearly completely undifferentiated. These are followed by intrusions of typical nepheline basalts, and the final effusive stages are alk. lavas. Their geol. relation to the volcanism of the nepheline basalts, however, is not yet completely investigated. The ultra-basic-alk. magnetism is intimately connected with the trap-area effusions, and both types of extrusions are parallel and simultaneous. The ultrabasics, therefore, are typical differentiates from the basaltic magma and split off in the period of their volcanic cycle. S. is of the opinion that there must be serious doubts whether large reservoirs of liquid basalt magma would exist from the early origin of the volcanic cycle; one cannot assume that the coexistence of the basaltic masses and of the ultrabasic-alk. intrusions would be without any genetic interrelation. S. is further of the opinion that it is possible that both groups have originated from locally neighboring melt masses. They behave both as if they would be independent magmatic bodies although they occur in the same geol. period and province. The volcanisms of both types are immediately connected with local platform conditions in deep tectonic fracturing zones, in the folding mechanisms of geosynclines. These are described in detail by examples taken from the literature. It is striking how calcite and dolomite play in the alk. ultrabasics a role similar to that of quartz in acidic intrusions, with the important difference, however, that the carbonates do not form veins but occur in stocks.

Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 4,
pp. 779-781 (USSR)

ABSTRACT:

The author says that the formerly uniform platform of South-America and Africa was disrupted by the ocean. An amazing similarity of the history of these two regions during Paleozoic and Mesozoic time speaks in favor of this. The agreement of the cross sections of Silurian and Devonian is such that one could rather speak of identity. The geophysical and geological data disprove, however, the known theory of the continental drift. The only explanation of the recent image can be the sinking of vast continental areas and the ocean formation in their place. Also, the age of these sinkings can be determined: the geological identity of the history of the two platforms is conserved till the begin of Jurassic. However, the sinkings did not lead to a

this phenomenon has not attracted due attention. As known, primary geosynclinals are, during the development of a belt of folds, gradually transformed into secondary and final ones. This is doubtlessly a consequence of a thickening of the earth's crust in the course of single geosynclinal cycles. The relative rôle of the acid magmas during the later cycles increases, that of the basic and ultrabasic magma is reduced. Thus a belt of folds is an open deep basin during the first development phases in the region of which the previously existing structures vanished. Thus the two oceans are outlined by future belts of folds. This way the author arrives at the conception that the formation of the two oceans is a process which is similar to the "brake" and regeneration of structures according to Shtille (Stille, reference 11). However, this process is not bound for all times to always the same regions and does not comprise the entire earth at a certain time. There are 11 references, 7 of which are Soviet.

AUTHOR: Sheynmann, Yu.M.

SOV/11-59-1-3/16

TITLE: On the Stratigraphic Position of the Sinian Complex (K stratigrafičeskому положению синийского комплекса)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1959, № 1, pp 30-35 (USSR)

ABSTRACT: No international agreement has been reached on how to classify the deposits of the late Pre-Cambrian period. These deposits bear different names in foreign countries. The Soviet Interdepartmental Stratigraphic Committee has decided to give to the whole series of these deposits the name of Sinian complex (series). From the stratigraphic point of view, these rocks are rather nearer to the Paleozoic layers, but from the paleontologic point of view they are very different and do not contain any variegated fauna fossils, which are found in the overlying rocks of the Lower Cambrian period. The author describes similar rock formations all over the world and comes to the conclusion that there cannot be a definite delimitation of these rocks. He defines this series rather by its absolute age (700 to 800,000,000 years) than

Card 1/2

by its stratigraphic characteristics.

equal to 2000 Å in the freshly hardened martensite steel and to 3000 Å after 10^4 min of aging. The low value of the elastic limit after hardening of martensite steel and the effect of aging on it cannot be explained satisfactorily by the first stages of carbide reactions (Cohen's model). The extent of self-tempering in steel hardening with high M_s temperatures is so great that these first stages of carbide reactions are completed, to a great degree even before complete cooling from the quenching temperature. For the steel used, the extent of self-tempering corresponds to an aging of some 10^4 sec at room temperature (for the reaction controlled by a carbon diffusion). The study was reviewed by Karel Mazanec, Research Institute of Metallurgy, VZKG, Ostrava. Orig. art. has: 5 figures, 3 formulas, and 2 tables. [Based on authors' abstract] [NT]

Title : Measures to reduce morbidity among workers and service personnel of the Gor'kiy hydroelectric power plant (GES) during 1950-1952

Periodical : Sov. zdrav.^H, 2, 22-27, Mar-Apr, 1955

Abstract : The chair of public health organization of the Gor'kiy Medical Institute imeni S. M. Kirov and the medical personnel of the Gor'kiy GES made a detailed study, during 1950-1952, of working and living conditions of workers employed on GES construction project. A thorough analysis of causes of illness was indicated and measures to reduce morbidity rate were taken. People employed in handling food, employees in institutions for children, and all those with past history of gastro-intestinal disorders have been subjected to periodic bacteriological examinations. Decrease in morbidity among workers and service personnel and advance in labor productivity are dependent on greater use of preventive measures and extension of dispensary system of medical aid. Increasingly high value of research to planning provides possibility for taking proper preventive medical action.

Institution: Chair of Public Health Service Organization, Gor'kiy Medical Institute imeni S. M. Kirov (V. N. Uzdennikova, Head) and the Hospital of Gor'kiy GES (*Chief Physician).
