TITLE: A method for producing modified carbon black. Class 22, No. 169153

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 6, 1965, 34

TOPIC TAGS: carbon black

ABSTRACT: This Author's Certificate introduces a method for producing modified carbon black by introducing admixtures to a liquid hydrocarbon stock or to a mixture of gas and carbon. The quality of the carbon black is improved and a wider selection of raw materials is provided by using organic or inorganic compounds of metals in group VI of the periodic table.

TITLE: The theory of automatic control systems with modulation

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,
v.6, no.1, 1963, 179-191

TEXT: Servomechanisms with a.c.-powered elements, control systems with continuous amplitude modulation or with pulse amplitude modulation, automatic control systems with discontinuously varying parameters, etc., can be reduced to a system described by linear differential equations with continuously and piecewise continuously periodically varying coefficients which satisfy the Dirichlet conditions. Using Hill's method, based on the Laplace transform, the solution is obtained in the form of a series of modulated harmonics. The characteristic polynomial of the system is found in the form of an infinite determinant, whose convergence is examined. The conditions are found under which the problem can be reduced to the solution of linear differential equations with constant coefficients.

ABSTRACT: A study was made of the maximum permissible amount of deformation of billets at which maximum strain hardening does not affect the initial mechanical properties of the material. The samples were exposed to stretching prior to obtaining 2, 3, 5, 10, 12 and 15% of the residual elongation, after which the experimental data were correlated with those obtained by calculation. It was determined that in work-hardening by tension up to 5—5%, the mechanical proper-

TOPIC TAGS: sheet metal, vibration analysis, metal test, material deformation, vibration wrapping

ABSTRACT: Conditions for modernizing wrapping presses were analyzed for the purpose of using vibrational forming of blanks at the final stage of wrapping. A laboratory setup was developed for wrap-forming vibration. According to the results obtained from tests on the experimental setup, it was determined that the combination of static and vibrational methods of application of force in forming a specimen reduces the number of transitory stages by 25—30%. The deformation resistance of metal is reduced and the area of uniform deformations is slightly increased. The

TITLE: Stretch forming of metal sheets with vibrations

SOURCE: Kuznechno-shtampovochnoye proizvodstvo, no. 4, 1966, 23-24

TOPIC TAGS: metal forming, sheet forming, stretch forming, vibration forming

ABSTRACT: The effect of vibration in stretch forming has been investigated in forming D16AM aluminum-alloy sheets (200 x 300 x 1 mm). Vibrations were applied either perpendicular to or in the direction of the stretching pressure. Perpendicular vibrations with a force of 110-355 kg, a frequency of 45-70 Hz, and an amplitude of 0.3-0.8 mm increased considerably the relative deformation at the same stretching pressure. The relative deformations achieved in the first four stretch forming steps were 7.0, 12.5, 15.5, and 17.0% without vibration and 11.0, 17.5, 15.5, and 26.0 with vibration. Vibration in the direction of stretching pressure at a frequency of 20-30 Hz and an amplitude of 0.09-0.22 mm had a similar effect. It increased the relative deformation in five steps from 7.5, 9.5, 12.0, 14.0, and 16.0% to 13.5, 16.0, 20.0, 24.0, and 27.0%. Thus, vibration increases the relative deformation and makes it possible to achieve the desired shape in fewer steps or to use a lower pressure to achieve the same relative deformation compared to

TITLE: Study of the capacity of semifinished products of V95-2 alloy for cold deformation

SOURCE: Alyuminiyevyye splavy, no. 4, 1966. Zharoprochnyye i vysokoprochnyye splavy (Heat resistant and high-strength alloys), 307-311

TOPIC TAGS: cold working, metal deformation, aluminum alloy property

ABSTRACT: Semifinished products of V95-2 alloy (sheets of 1.5 and 4 mm, tubes 40 x 1.5 and 20 x 1.5 mm, sections Pr100-6 and Pr113-2) were tested for cold deformation. Their chemical composition was (in %): Cu 1.5-2.7, Mg 1.3-2.7, Zn 3.0-4.7, Mn 0.2-0.8, Fe up to 0.8, Si up to 0.7, Ti no more than 0.05, Cr up to 0.25. It was found that the sheet material in the annealed and freshly quenched state can be subjected to stamping, forming and shaping operations. For sections with wall thicknesses of 1.0-1.5 mm in the quenched and artificially aged state, the following operations are permissible: bending with radii up to 120 mm, fullering with extension and fitting of the vertical flange with a radius up to 90 mm, incisions with a deformation up to 40%, beveling at angles up to 15°. Tubes 40-20 mm in diameter with a wall thickness of 1.5 mm can be subjected to bending with radii up to 70 mm in the annealed and freshly

TITLE: On the Application of the Method of Small Parameters
to Systems of Differential Equations with Discontinuous
Right-hand Terms

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniya tekhnicheskikh
nauk, Mekhanika i mashinostroyeniye, 1959, Nr 6,
pp 51-59 (USSR)

ABSTRACT: The method described is based on Poincare's theory
(Ref 1), where a solution of the system of differential
equations, such as Eq (1.1) for $u = 0$, can be found.
Similar periodic solutions can be derived for
sufficiently small u . Because in this case the
analytical continuity of solutions should be maintained,
the function $F_s(t; x_1, \dots, x_n; u)$ must be
analytical. If Lyapunov's theory is applied, then the
right-hand term of Eq (1) will become more limited.
Thus, the method described can be applied in such cases
as dry friction, relay or partly linear systems. The
above limitations can be avoided if a series of periodic
solutions of the function F_s are defined as in the
case of smooth surfaces with broken continuity. This

TITLE: Investigation of Nearly Piece-linear Dynamic SystemsPERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,
1960, Vol. 3, No. 3, pp.478 - 495

TEXT: The results obtained in an earlier work (Ref. 3) are extended to the nearly piece-linear systems by employing the method of a small parameter (Refs. 1-3). It is assumed that depending on the state and possibly the previous behaviour of the dynamic system considered, this can be described by one of N systems of the differential equations of the type (Ref. 9):

$$\frac{dx_i^j}{dt} = x_i^j(t; x_1^j, \dots, x_{n_j}^j) \quad (1.1)$$

$$(i = 1, 2, \dots, n_j; j = 1, 2, \dots, N).$$

X

The transformation from p description to q system of description takes place when the transformation point is on the surface:
Card 1/6

Investigation of Nearly Piece-linear Dynamic Systems

$$s_{pq}(t; x_1^p, \dots, x_{n_p}^p) = 0; \quad \Omega_{pq}^s(t; x_1^p, \dots, x_{n_p}^p) > 0 \quad (1.2)$$

$$(s = 1, \dots, r_{pq});$$

Here, the values of the new variables $x_1^q, \dots, x_{n_q}^q$ at the instant t are determined by the values of the previous variables at the same instant and are defined by:

$$x_j^q = G^{pq}(t; x_1^p, \dots, x_{n_p}^p) \quad (1.3)$$

$$(j = 1, 2, \dots, n_q).$$

The functions x_i^j of each system of Eqs. (1.1) and also the
Card 2/6

82456

S/141/60/003/03/011/014

E192/E382

Investigation of Nearly Piece-linear Dynamic Systems

functions S , Ω , G are capable of being differentiated a suitable number of times. Further, it is assumed that if the system is non-autonomous, i.e. if the time t is explicitly present in at least one of the functions X , S , Ω , G , the functions are periodic with a period 2π . The phase space of the above system consists of phase sub-spaces Φ_1, \dots, Φ_n .

The transition from one phase sub-space Φ_p into another sub-space Φ_q is effected in accordance with the transformation defined by Eq (1.3), provided the conditions of Eq.(1.2) are met. Consequently, the points of the surface S_{pq} of the phase sub-space Φ_p , which satisfy Eq. (13), can be regarded as being identical with the corresponding points of the phase sub-space Φ_q . As an example of a system which can be described by the above equations, the following system of differential equations:

Card 3/6

82456

S/141/60/005/03/011/014

Investigation of Nearly Piece-linear Dynamic Systems
E192/E382

$$\frac{dx_i}{dt} = f_i(t; x_1, \dots, x_n) \quad (1.4)$$
$$(i = 1, 2, \dots, n)$$

is considered. In this system, the functions φ_i are subject to the discontinuities of the first kind on the smooth surfaces S_α , which split the space D of the variables x_1, x_2, \dots, x_n and t into regions D_1, \dots, D_k . In each of these regions, D_j , the equations of motion are in the form of Eqs. (1.5), where f_i^j are smooth functions in D_j . In order to obtain a complete description of the phase-point motion it is necessary to determine what happens when the point reaches the boundary of the region D_j . For this purpose, various special cases of the phase trajectories lying in the vicinity of the discontinuity surfaces S_α

Card 4/6

82456

S/141/60/003/03/011/014

E192/E382

Investigation of Nearly Piece-linear Dynamic Systems

are investigated. In the sub-space Φ_k , a trajectory L is described by a system of vectorial equations defined by Eq. (2.1). Now the transformation $T_k G^{k-1}$ of the solution of Eqs (2.1) is in the form of Eqs (2.5). Investigation of the stability of the periodic solutions of the system represented by Eqs (1.1) for $\mu = 0$ is done by considering the characteristic equation, which is in the form of Eq (3.6). The periodic solution is stable for all the roots of the characteristic equation lying inside a unit circle. It is shown that the periodic solutions corresponding to the generating solutions for μ are stable if $(n - m)$ roots of the characteristic equation, are smaller than unity and if the roots of Eq. (4.6) lie in the lefthand semiplane. The above analytical results are used to investigate some special systems. The first of these is described by Eqs (5.1). The second system is

TITLE: On certain cases of originating periodic motions from singular
trajectories

SOURCE: Matematicheskiy sbornik, v. 61, no. 4, 1963, 443-466

TOPIC TAGS: motion generation, stable periodic motion, saddle-node-type
equilibrium, saddle-type equilibrium, separatrix surface, point transformation
method

ABSTRACT: The following two cases of originating stable periodic motions from
singular trajectories are investigated: a) from a trajectory going from saddle
node to saddle node and b) from a trajectory going from saddle to saddle. In
the first case is considered the system of differential equations

$$\frac{dx_1}{dt} = X_1(x_0, x_1, \dots, x_n; \mu), \quad i = 0, 1, \dots, n, \quad (1)$$

where X_i are definite analytic functions with respect to the variables

Card 1/3

L 17835-63

ACCESSION NR: AP3004793

0

x_0, x_1, \dots, x_n . Characteristics of the composite state of the saddle-node type are established for the parameter μ . On the basis of these characteristics it is proved that when the composite state of the saddle-node type vanishes, only one periodic motion originates from the trajectory going from the saddle node to a saddle node which is not located on the separatrix surface. This motion is stable either at $t \rightarrow +\infty$ or at $t \rightarrow -\infty$. In the second case is considered the system of differential equations

$$\frac{dx_i}{dt} = X_i(x_1, \dots, x_n; \mu), \quad i = 1, \dots, n, \quad (2)$$

where X_i is a twice continuously differentiable function with respect to the arguments x_1, \dots, x_n , and μ is the parameter. Assuming that at $\mu = 0$ system (2) has a simple, saddle-type state of equilibrium in which all roots of the characteristic equation except the root $\lambda_n > 0$ have negative real parts, the theorem is proved by establishing that when

$$-\operatorname{Re}\lambda_i(0) > \lambda_n(0), \quad i = 1, \dots, n-1,$$

Card 2/3

L 17835-63

2

ACCESSION NR: AP3004793

then for sufficiently small $\mu > 0$ ($\mu < 0$) only one stable periodic motion originates from the trajectory going from the saddle to the saddle. The proof of the theorem was based on the proof of the existence of a fixed point of a certain point transformation. "The author thanks his scientific supervisor Yu. I. Neimark and Ye. A. Leontovich-Andronova for their useful advice and for reviewing the article." Orig. art. has: 98 formulas and 5 figures.

PURPOSE: This textbook is intended for students in engineering-economic branches of Railway Transportation Institutes, as well as for railway workers engaged in the independent study of railway economics.

COVERAGE: The economic aspects of railway transportation are discussed in the textbook. It covers such subjects as technical-economic problems, the most efficient way to use available facilities, methods for planning and organizing various branches of transportation operations and production, wages, costs, finances, and business accountability (khozraschet).

TITLE: The Zonality of Moderate and High Latitudes of the
Southern Hemisphere

PERIODICAL: Priroda, 1959, Nr 7, pp 19-26 (USSR)

ABSTRACT: The article deals with the establishment of zones of moderate and high latitudes of the Southern Hemisphere based on the findings of the Antarctic expeditions of the AS USSR during 1955-56, 1956-57, and 1957-58, as well as those of Western scientists. It also discusses hydrological and biological aspects of that region. The chart enclosed between pp 24 and 25 shows the boundaries of the antarctic, subantarctic, and moderate zones as well as other geographical data compiled by the expeditionary ship "Lena", the diesel-electric ship "Ob", and the diesel ship "Kooperatsiya". The article mentions the names of the following Soviet scientists: B.P. Alisov, G.M. Tauber, V.I. Shil'nikov, K.A. Brodskiy, K.K. Markov, Tolstikov, Golyshev, and

AUTHOR: Shil'nikov, V. I.

TITLE: Experimental calculation of the volume of icebergs in
Antarctica

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 10, 1961, 56,
abstract 10V371 (V sb. Probl. Arktiki i Antarktiki,
no. 6, L., Morsk. transport, 1960, 27-36)

TEXT: The experimental calculation is stated for the volume of icebergs
in Antarctica in the sector between 44° and 168° E. 31,300 icebergs, con-
taining 4165 km^3 of fresh ice, are situated in the area under considera-
tion. This value comprises 85% of the average amount of the annual dis-
charge of fresh water and ice in the Arctic Ocean. In the eastern half
of the described area of Antarctica there is 8 times more land ice than
in the western half. In their vertical and horizontal dimensions, the
icebergs of the eastern part considerably exceed those of the western half.

Experimental calculation of...

S/169/61/000/010/021/053
D228/D304

The average duration for the existence of icebergs is 12 years. The chief role in the general volume of ice "breakage" in the sea belongs to the discharge glaciers. The "productivity" of ice shelves is two times less than the volume of icebergs deposited from the discharge glaciers. The significance of the land-ice barrier in the general "productivity" is small. 4 references. [Abstracter's note: Complete translation.]

Title : Prevention of Pulmonary Diseases in Lambs During the Summer Period

Orig Pub : Ovtsevodstvo, 1957, No 6, 44-45

Abstract : It is pointed out that the incidence of pulmonary diseases in lambs in the summertime is due to overheating of the organism, associated with a high temperature of the air and prolonged insolation. The keeping of lambs under light awnings in hot weather, and equipping artesian and shaft wells with tanks for heating the water before watering the animals, constitute the surest measures for preventing pulmonary diseases in lambs.

TITLE: Synthesis of amino acids of the hexane series and of polyamides based on such acids

SOURCE: AN SSSR, Institut neftekhimicheskogo sinteza. Sintez i svoystva monomerov (The synthesis and properties of monomers). Moscow, Izd-vo Nauka, 1964, 220-225

TOPIC TAGS: amino acid, polyamide, Nylon, thermal stability

ABSTRACT: New amino acids have been prepared and converted to new polyamides with high thermal stability. Table 1 of the Enclosure lists the amino acid monomers and the melting points of the monomers and polymers (all the monomers except the (4-aminocyclohexyl acetic acids are new). Fig. 1 of the Enclosure shows a typical thermomechanical curve. Polycondensation was carried out in sealed ampuls under

Card 1/4

L 20684-65
ACCESSION NR: AT5002132

nitrogen at 200—320C. The polyamides from the trans monomers were insoluble in the solvents common for polyamides, and were soluble only in concentrated H₂SO₄. The polyamides from the CIS monomers were soluble in the common polyamide-solvents. Fusible high-thermal-stability copolymers were prepared from the new amino acids and ϵ -caprolactam or ζ -aminoenanthic acid. The copolymers melted at temperatures of up to 450C and were soluble both in H₂SO₄ and in cresol. Orig. art. has 5 formulas, 2 figures and 1 table.

ABSTRACT: The author studies

$$P\left(\frac{\partial}{\partial t}, \frac{\partial}{\partial x_1}, \dots, \frac{\partial}{\partial x_n}\right) u(t, x_1, \dots, x_n) = 0 \quad (1)$$

$(t > 0, -\infty < x_j < \infty, j = 1, 2, \dots, n).$

to find conditions at $t = 0$ (or if necessary as $t \rightarrow \infty$) to guarantee existence of the solution $u(t, x)$. Each such collection of conditions also forms, by definition, a proper boundary value problem in a half space for (1). He describes the class of functions in which proper problems are given and proves one basic theorem, given roughly as: suppose on each of the sets A_j defined by the author in terms

of the terms in the considered differential equation, there is given a function $v_j(\sigma)$ extendable to the entire real Euclidean n -space to a square integrable function, then

$$\frac{\partial^m u(t, x)}{\partial t^m} = \sum_{k=0}^{m-1} p_k \left(t \frac{\partial}{\partial x} \right) \frac{\partial^k u(t, x)}{\partial t^k}, \quad x = (x_1, \dots, x_n), \quad (2)$$

has a solution $u(t, x)$ for which the Fourier transform of

$$\frac{\partial^{l-1} u(0, x)}{\partial t^{l-1}}$$

coincides on A_{j-1} with $v_{j-1}(\sigma)$, $j = 1, \dots, m$. This solution $u(t, x)$ for each $t \geq 0$ is the square integrable and as $t \rightarrow \infty$ grows not faster than a power of t together with its first $m-1$ derivatives in t . It is unique among such solutions and continuously dependent on the $v_j(\sigma)$ with the proper topology. The author then defines a class of regular functions and reduces the problem of their general solution to that of construction of a fundamental solution. He computes the fundamental solution for an homogeneous regular equation with simple characteristic roots. Orig. art. has: 108 formulas.
