TITLE: Copying Device for Automatic Welding of Overlap Joints by Inclined Electrode

PERIODICAL: Avtomaticheskaya svarka, 1960, No. 6, pp. 60-62

TEXT: The usual copying devices on standard welding automats like the TC-17m (TS-17m) are not suited for welding overlap joints with a top sheet of 10 mm thickness as the copying roller frequently loses contact with the vertical metal edge when it slightly deviates to the side. A new device developed at the welding laboratory of TsNIITMASH, which is actually a simple attachment to the welding "tractor" TC-17my (TS-17mu) (Fig. 1), ensures more accurate copying, and the copying roller cannot easily deviate from the copied edge. The new device is shown in Figure 2. Its mobile part consists of a block (1) with inserted free rotating axle bearing the copying roller (3); a guide (4), and a clamp (7) holding the nozzle (8). The guide (4) and

Card 1/5

the clamp (7) are so connected with a lever (11) that the position of the clamp and hence the incline angle of the nozzle can be regulated using the nut (6). The block (1) is connected to the guide (4) by a screw (2) with a handle. The distance between the electrode end and the copying roller in the plane at right angles to the welding line can be smoothly adjusted by turning the handle. This is necessary for initial setting for welding, as well as later for compensating the wear of the nozzle. The "tractor" need not to be stopped to displace the electrode. The copying roller is pressed permanently to the vertical joint edge by a spring (9). The spring pressure is adjusted by a nut (10). Current is supplied to the nozzle by flexible buses. The device has been tested and proved suitable for welding straight and curved overlaps as well as T-joints. There are 2 figures.

TITLE: The operation of welded joints of austenite steam pipes (experiment at the Chelyabinsk TETs-1)

SOURCE: Energomashinostroyeniye, no. 9, 1965, 37-40

TOPIC TAGS: weld defect, weld evaluation, metal welding, austenite steel, pipe

ABSTRACT: The authors present the generalized results of an experiment concerning the operation of austenite (steel 1Kh18N12T) welded joints of the steam piping of the SVP complex of the Chelyabinsk TETs-1 over the 1959 - 1964 period. The SVP complex consists of two 68SP300/215 boilers and SVP-50-3 turbines. The vapor pressure ahead of the turbine is 210 at, temperature 555 - 560C. The number of welded joints is 342, approximately 70% of which were made on the spot during construction. The present article presents in the form of graphs and tables the accumulated number of working hours, changes in vulnerability (with time, and according to depth), comparative changes in vulnerability of austenite and nonaustenite joints, vulnerability of thick sections as compared with the vulnerability of the entire system, and the vulnerability of tube joints utilizing 10 different types of alloying. Results show that in spite of a certain increase in system's reliability the thermal processing of 1Kh18N12T steel joints does not secure a reliable operation because of the tendency of the

Card 1/2

steel to local failures in the vicinity of joints. Tests at the TsNIITmash, TsKTI, and VTI indicate that the steel should be replaced by Kh16N9M2 which is by its composition close to the US steel AISI 316 which proved very successful in American thermal power plants with vapor temperatures up to 650C. TITLE: Brittle fractures of welded joints

SOURCE: Avtomaticheskaya svarka, no. 2, 1966, 20-24

TOPIC TAGS: material fracture, brittleness, yield strength, weld evaluation

ABSTRACT: The effect of weld sectors with lower yield strength on the character of fracture of welded joints is examined. Such sectors are present in many welds due to the nonuniformity of their mechanical properties and they are more plastic than the other weld interlayers and, since, as a rule, plastic metal subjected to uniform tensile stresses undergoes brittle fracture, these sectors may, if sufficiently thin, be a factor in the brittle fracture of welded joints. The greatest danger of brittle fracture along a sector of this kind arises when the operating conditions of the welded joint are such that it is exposed to tensile or bending stresses. The danger of brittle fracture along the more plastic weld sector increases with decrease in the relative thickness of the sector; this indicates a gradual ductile-to-brittle tran-

0

sition of the character of fracture of this sector. Thus, the most dangerous -- from the standpoint of brittle fracture -- is the case where the difference between the yield points of the metal of the more plastic sector and the other sectors of the weld is large and the stress-strain diagram of the metal of the plastic sector approximates the diagram of an ideally plastic metal. Plastic deformation (work hardening) is one way of relieving the stressed state and thus reducing this danger. In cases of intricately shaped welds, such as X-welds, the most dangerous -- from the standpoint of the formation of a brittle crack -- is the weld root. In such cases an increase in weld-root clearance may be recommended in order to reduce the danger of brittle fracture. Yet another major means of increasing the reliability of performance of welded joints with a relatively narrow softer sector is the build-up with a metal having a high ductility margin (e.g. austenitic metal); this applies only to the spots most susceptible to brittle cracking (e.g. weld root), with the other parts of the weld being built-up with less ductile metal. Orig. art. has: 5 figures.

Conference of Young Specialists (Konferentsiya molodykh  
spetsialistov)

Ogneupr, 1959, Nr 1, PP 47-47 (USSR)

PERIODICAL:  
ABSTRACT:

This conference of young specialists of the Vsesoyuznyy Institut ogneupr (All Union Institute of Refractories) was held in Leningrad on November 13-14, 1959, with the participation of representatives of the youth workers and the Uralskiy Institut ogneupr (Uralian Institute of Refractories). The conference dealt with the work of young engineers and technicians. N. P. Zorkov, head of the Institute, outlined in his opening speech the tasks of young specialists of various special branches, designating it as successful. Further, the following reports were mentioned: V. G. Jeger spoke about manufacturing methods of sinterable panicles of boric siliceous rocks (borovitchukny); Krenovskaya reported on test results of the properties of magnesium solutions on liquid glass; the dynamic method of I. V. Plakhsavsky (UNIO) reported on the modulus of elasticity at temperatures up to 1200°C; G. G. Mikhovskaya spoke about the examination of the changes of heat composition of worn-out refractory magnesite-chromite products; B. G. Bakhtin reported on elaboration results of spectroscopic method for the alumina content in types of clay; G. G. Shleusich stated the causes of bar fracture of the press CH-143 by means of tensometric transducer for the automatic control of mold charging on the press SM-123; D. A. Koba used a tensometric transducer for the automatic control of mold charging on the working out of the design; V. M. Labelev reported on scale testing devices of a new system; V. Z. Shron reported on the design of water supply and analysis; M. M. Levin reported on the design of air dust collection.

Abstract : A drop of tar was induced into the region where the vaginal  
epithelium passes into the uterine epithelium (which is the  
region of the cervix of the uterus) in 23 rats. Three-45  
days later the animals were killed and the cervix of the  
uterine region was histologically examined. It was estab-  
lished that the epithelium of the various sections of the  
sexual ducts shows different reactions when an inflammation  
is present. The prismatic epithelium of the uterine horns  
and of the uterine body proliferates somewhat and forms small

is characterized by alterations in vascular permeability and reactive changes in the nerve cells of the cortex. In the second phase (second to tenth day) of the disease, the vascular reaction progressively develops; swelling, chromatolysis, and hydropic changes in the cells of the neocortex are at first intensified, then reduced, but continue to progress in the phylogenetically older parts of the brain. In the third phase (tenth to thirtieth day), there is increased shrivelling and hyperchromatosis of the cortical nerve cells and a simultaneous increase in the dystrophic changes of the intraorgan nerve cells. In the fourth phase (second to third month of disease), the changes in the internal organs progress, while

TITLE: The dynamics of immuno-allergic and morphological reactions in experimental anthrax vaccination

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 3, 1965, 106-111

TOPIC TAGS: guinea pigs, anthrax, anthrax vaccine, immunization, vaccination, morphology, mitosis, epidemiology

ABSTRACT: The present study investigated the immuno-allergic and morphological changes in the organism of anthrax vaccinated animals to determine whether they reflect two sides of the same process. Two groups of experimental guinea pigs weighing 300-350 g were vaccinated subcutaneously in the groin with different doses of STT-1 anthrax vaccine (40 million spores and 1 million spore doses). Anthraxin tests were performed on animals from each group at regular periods from 2 to 115 days after vaccination. In addition to a morphological examination of spleen and lymph sections, mitotic activity of spleen

Card 1/3

L 43897-65

ACCESSION NR: AP5008019

cells was determined. Indices for the immuno-allergic and morphological changes were statistically processed and compared. In animals vaccinated with a large SIT-1 anthrax vaccine dose, mitotic activity started to increase immediately after vaccination and reached a maximum by the end of the first month. At the same time the number of cellular degenerative changes including pyroninophilia and plasmation also increased. Both processes were normalized by the end of the second month. In animals vaccinated with a small SIT-1 anthrax vaccine dose, mitotic activity and degenerative changes of cells did not differ significantly from those of control animals. A definite chronological relationship was established between the development of immuno-allergic and morphological changes in cells in response to antigen administration depending on dose. These reactions resulting from the successive involvement of different links of the adaptive mechanisms appear to reflect two sides of the same process in which the body interacts with external factors. TITLE:

Steric Hindrance in Quaternary Salts of 2-Arylbenzothiazoles, 2-Arylbenzimidazoles, and 2-Arylpyridines (O prostranstvennykh prepyatstviyakh v chetvertichnykh solyakh 2-arilbenzotiazolov, 2-arilbenzimidazolov i 2-arilpiridinov)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1290 - 1299 (USSR)

ABSTRACT:

The authors are now in a position to supplement the observations reported on in a previous article (Ref 1) by data concerning the light absorption of 2-p-dimethylaminophenylbenzimidazole salts. In the article under review the three salts (III), (IV), and (V) are compared in regard of their absorptions. The observations made with these salts were the same as in the case of the salts (I) and (II), where there occurred, in the transition from the simple to the quaternary salt, a shift of the absorption band not toward the long-wave, but toward the short-wave range of the spectrum (Ref 1). The approach of alkyls to the nitrogen atoms in the heterocycle causes a shift of the absorption band toward the short-wave range of the spectrum - to

benzimidazoles, and 2-Arylpyridines

SOV/79-29-4-55/77

a lesser degree in the case of salt (IV), but to a particularly high degree with salt (V). This fact suggests a disturbance of the co-planarity of the nuclei due to steric hindrance. This disturbance is known to cause, in the case of aromatic compounds, not only a shift of the absorption band toward the short-wave range of the spectrum, but also a reduction of the absorption intensity (Ref 2). A comparison of the intensities of simple and quaternary salts of 2-dimethylaminophenyl derivatives of nitrogen heterocycles is difficult, and for this reason the spectrum determinations were extended to the salts of the 2-aryl derivatives of nitrogen heterocycles without amino groups. In the case of a sufficient sulphuric acid excess the alcoholysis of such salts in alcohol solutions may be suppressed, and it is possible to determine not only the absorption maximum of the salt but also its molecular extinction. The absorption spectra in the alcoholic solution of some 2-arylbenzothiazoles, 2-arylbenzimidazoles, 2- and 4-phenylpyridines as well as 2-phenylbenzoxazole, their sulphates and quaternary salts were determined. A comparison

SOV/79-29-4-55/77

of the absorption curves of the sulphates and quaternary salts showed that in all cases (except 4-phenylpyridine) the absorption maxima of the quaternary salts shifted toward the short-wave range of the spectrum, and the intensities declined (Figs 1-7). There are 7 figures and 19 references, 3 of which are Soviet.

ABSTRACT: The authors polymerized 1,2- and 1,4-dihydronaphthalenes in tetrahydrofuran at -80, 0 and +40C with varying amounts of sodium naphthalene catalyst and attempted to copolymerize these dialins with styrene (-80C, 48 hrs.), isoprene (-65C, 48 hrs.) and methylmethacrylate (standard conditions) in an attempt to obtain materials with improved heat resistance and solubility in standard solvents. It was found that anionic polymerization of 1,2-dialin is possible in the presence of sodium naphthalene, while the 1,4-isomer does not yield a polymer under these conditions. The former

TOPIC TAGS: crosslinked polymer, ion exchange resin, polymaleic anhydride, ethylene glycol crosslinking, hexamethylene diamine crosslinking

ABSTRACT: Crosslinked polymers were obtained by treating polymaleic anhydride with ethylene glycol (10-40 mol. %) or hexamethylene diamine (procedure given). The crosslinked polymers exhibited properties of carboxylic ion exchangers (static exchange capacity up to 12 meq/g dry cationite, dynamic capacity up to 6 in alkaline and 1 meq/g in neutral media). The resins showed high regeneration at room temperature, but were unstable in hot water and hydrolyzed readily.

TITLE: Photochemical graft polymerization of methyl methacrylate on inorganic oxides

SOURCE: AN UkrSSR. Modifikatsiya svoystv polimerov i polimernykh materialov (Modification of the properties of polymers and polymeric materials). Kiev, Naukova dumka, 1965, 27-29

TOPIC TAGS: polymethylmethacrylate, photopolymerization, styrene, radiation polymerization

ABSTRACT: In order to determine whether a more grafted polymer can be obtained if the possibility of homogeneous initiation of the polymer chain is excluded, the photochemical graft polymerization of methyl methacrylate was studied on the surface of a series of inorganic oxides (ZnO, TiO<sub>2</sub>, MgO, Al<sub>2</sub>O<sub>3</sub>, CuO, Cr<sub>2</sub>O<sub>3</sub>), ultraviolet light

Card 1/2

L 16038-66

ACC NR: AT6006240

being used ( $\lambda = 320 \text{ m}\mu$ ). Experiments showed that the photosensitized polymerization of acrylonitrile, vinyl acetate, styrene, and methyl methacrylate produces graft polymers in addition to the homopolymer. No polymer was produced when methyl methacrylate was irradiated with UV light in the absence of oxides. Graft polymers of methyl methacrylate were obtained in amounts of 11, 12, 17, and 47 wt.% on  $\text{Al}_2\text{O}_3$ ,  $\text{TiO}_2$ ,  $\text{Cr}_2\text{O}_3$ , and  $\text{MgO}$  respectively. It is concluded that in the absence of chain initiation in the volume, the yield of the graft polymerization of the liquid monomer on inorganic oxides is one order of magnitude greater than the yield observed in radiation initiation. It is postulated, therefore, that methyl methacrylate radicals formed in an adsorbed layer or in a homogeneous phase under the influence of ionizing radiation inhibit the process of graft polymerization. TITLE: Reactivity of cycloolefins in addition reactions. 1. Kinetics and mechanism of iodine addition to cyclohexene in dimethylformamide.

SOURCE: Ukrainskiy khimicheskij zhurnal, v. 32, 1966, 260-268

TOPIC TAGS: reaction mechanism, reaction kinetics, cyclohexene

ABSTRACT: Cycloolefins are promising monomers for the production of heat-resistant polymers. The relationship between their reactivity and their structure has not been studied sufficiently to date. The purpose of the present work was to study the reactivity of the double bond in cycloolefins toward heterolytic addition, in relation to the structure of the unsaturated compound. It was found that the addition of iodine to cyclohexene is an equilibrium process described by the kinetic equation:

$$v = k_3[C_6H_{10}][I_2]^2 - k_2[C_6H_{10} \cdot I_2][I_2].$$

The diiodide generated decomposes slowly into iodocyclohexene and HI. The equilibrium  $I^- + I_2 = I_3^-$  in dimethylformamide is displaced almost entirely to the right.

TITLE: Oxide photosensitized polymerization of methylmethacrylate

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 32, no. 1, 1966, 105-106

TOPIC TAGS: methylmethacrylate, polymerization, radical polymerization, free radical

ABSTRACT: Photosensitized polymerization of methylmethacrylate in the presence of ZnO, MgO, Cr<sub>2</sub>O<sub>3</sub>, Al<sub>2</sub>O<sub>3</sub>, and TiO<sub>2</sub> was studied. Samples containing 0.125 g oxide per milliliter of methylmethacrylate were placed in air-free ampoules made of molybdenum glass and subjected to 6 hour irradiation from PRK-4 mercury-quartz lamps at 20°C. The yields of homopolymer with the oxides (wt % based on oxide) were: MgO-100%, ZnO-80%, TiO<sub>2</sub>-50%, Al<sub>2</sub>O<sub>3</sub>-30%, CuO-20%, and Cr<sub>2</sub>O<sub>3</sub>-85%. It is postulated that photosensitized polymerization of methylmethacrylate in the presence of metal oxides

ABSTRACT: The integral coefficients of diffusion and the respective diffusion activation energies of chloroform, carbon tetrachloride, and tetrachlorethylene are determined at temperatures of 20, 40, and 60C. A calculation is made of the relations of the probabilities of destruction and crosslinking of polymer chains on irradiation of polyethylene films in the presence of chloroform, carbon tetrachloride, tetrachlorethylene, and benzophenone. The quantum yield of transverse

1017/1027AUTHORS: Kreshkov, A. P., Bork, V. A. and Shryrkova, R. A.TITLE: Determination of  $\equiv$ SiH bonds containing organosilicon compounds by amperometric titration in ethanol-benzene solution

PERIODICAL: Zhurnal analyticheskoy khimii, v.17, no. 3, 1962, 359-361

TEXT: A critical review includes previous works by the author using non-aqueous solutions. The new method is based on the reaction

carried out by titration of the sample with mercuric chloride, and using LiCl dissolved in a mixture of methanol and benzene. Procedure: 0.07-0.112 g of the sample, a hydrogen-containing organosilicon compound are dissolved in benzol and diluted to 25 ml. 0.5-2 ml of this solution is made up to 25 ml with a benzene-methanol mixture (1:1), containing 0.3 mol/l LiCl. The solution is mixed with a glass stirrer and a quantity of metallic mercury is introduced together with a mercury electrode. The polarographic wave was measured at  $E = -0.8\text{V}$ . After this, a solution of  $\text{HgCl}_2$  in a  $\text{CH}_3\text{OH}/\text{C}_6\text{H}_6$  (1:1) mixture containing 3 g  $\text{HgCl}_2$  in 100 ml is added from a microburet, and the height of the wave measured after the addition of each portion of  $\text{HgCl}_2$  solution. The results are plotted on a graph of the volume of added  $\text{HgCl}_2$  vs. the height of the wave. The diagrams show the

TITLE: On the Setting up of a Three-day Weather Forecast (K voprosu o sposobe sostavleniya prognoza pogody na tri dnya)

PERIODICAL: Tr. Tsentr. in-ta prognozov, 1957, Nr 63, pp 87-96

ABSTRACT: Aiming at a refinement of the current state of the methodology of the compilation of three-day weather forecasts, the author conceived the concept of the "elementary synoptic process" (ESP) for the purpose of his investigation and made an attempt to establish empirical relationships that govern the transition from one ESP to another. As a result of his work the author succeeded in establishing 14 rules. He employed them for the assessment of the character of the next ESP following by means of the compilation of prognostic 500-mb constant-pressure charts and surface pressure-distribution charts and obtained thereby the following results: 1. When the prediction for the next three days was made on the first day of an ESP cycle, the 500-mb pattern was verified in 52 cases and the surface pressure distribution in

51 cases out of a total of 58 cases. 2. When the prediction for the next three days was made on the second and third day of an ESP cycle already under way, the 500-mb pattern was verified in 70 cases and the surface pressure distribution in 67 cases out of a total of 79 cases. The prognostic rules adduced in the paper were established previously (Duletova, Pagava) with application to the prediction of the natural synoptic period. However, their application to the determination of the character of the subsequent ESP, judging from the investigation performed, yielded somewhat better results.

TITLE: Investigation of the Stress Distribution in the Base of a Horizontal Working (Issledovaniye raspredeleniya napryazheniy v pochve gorizonta'noy vyrabotki)

PERIODICAL: Sb. nauchn. rabot stud. Leningr. gorn. in-ta, 1957, Nr 2, pp 103-111

ABSTRACT: An enumeration of the factors which contribute to the heaving of the soil in workings. The essence of the optical method of stress investigation is briefly presented. A description follows of the results of an investigation of stresses in a gelatin model which represents the base of a horizontal working between pillars (the pillars are represented by rubber slugs). The ratio of the moduli of elasticity of the rubber and the gelatin is equivalent to the ratio of the moduli of elasticity of coal (20,000 kg/cm<sup>2</sup>) and clay (100 kg/cm<sup>2</sup>). The observational results are utilized in a complete calculation of the stresses, whereupon distribution curves are drawn. The heaving deformation is composed of a load-removal deformation,
