TITLE: New Instruments for Determining the Composition of a Substance

PERIODICAL: Priborostroyeniye, 1959, Nr 10, pp 26 - 30 (USSR)

ABSTRACT: A number of new instruments were developed at the Samostoyatel'-noye konstruktorskoye byuro priborov i sredstv avtomatizatsii (SKBPSA) (Independent Design-office for Instruments and Automation Devices). A portable rod pH-meter of the type PShP-58, which is suitable for the control of the hydrogen-ion concentration in aqueous solutions under industrial conditions, is first described in the paper under review. A similar instrument of the type PPP-58 is suitable for the determination of the hydrogen-ion concentration in salt extracts from the soil. A number of measurements can be carried out simultaneously with the pH-meter of the type PLP-58. The instrument consists of a Multi-electrode block and of a measuring instrument of the type PPP-58. The automatic electronic pH-meter of the type AEP-58 is used for measuring, recording and controlling the technological solutions in the textile industry. The installation consists of a pick-up for the pH value, a unit-type pH-meter of the type PVU (deve-

located at the TsLA) (Central Laboratory for Automation), and an automatic electronic photometer of the type EPP-09. The automatic photocolorimeter of the type AFK-57 is discussed as a further instrument. In this instrument, the light absorption is compared photocolorimetrically between the solution to be measured and a standard. The instrument is used for boiling processes of sulfite-cellulose. The automatic flue-gas controller of the type ARDM-58 measures, records and controls the flue-gas density, and is used in the fish- and meat-industry. The automatic fume-detector of the type ASZ-58 is used in the production of sulfite cellulose for indicating the appearance of undesirable SO_3 within the sulfur gas. The detector operates photoelectrically and is of high sensibility. Finally, the automatic smoke-detector of the type AKSD-57 for ships is discussed. The instrument belongs to the group of photoelectric detectors, for which the air is ducted by ventilators from the rooms to be controlled thru the pick-up and thru a viewing chamber. There are 8 figures.

hibernation, the development of the maximum sowing density, the effect of mineral fertilizers and the influence of preceding crops were also studied. It was established that by utilizing necessary cultivation practices, it is possible to obtain 25 - 30 tons of green mass and 26 - 32 kg of essential oil per ha. Growing of geranium styles by sowing plants in areas of 90 x 90 cm guarantees a yield of standard scions of up to 150 thousand per ha. This data as well as the data on geranium yields from model plots in some kolkhozes permits one to conclude that the cultivation and production of high yields of geranium is quite possible in the Ararat Valley. -- A. AUTHOR: Simonyan, Kh. A.

TITLE: Passage through the square resonance in a synchrotron with stable focusing

PERIODICAL: Izvestiya Akademii nauk Armyanskoy SSR. Seriya fiziko-matematicheskikh nauk, v. 14, no. 2, 1961, 71-78

TEXT: In a synchrotron with fixed focusing, a study has been made of the joint buildup effect of the fluctuation of square nonlinearity on the one hand, and the asymmetry of the field with respect to the orbital plane ($z = 0$) on the other. X

$\delta \left(\frac{1}{2} \frac{\partial^2 H}{\partial r^2} \right)$ characterizes the fluctuation of square nonlinearity, and $\frac{\partial^2 H}{\partial r \partial z}$ the asymmetry of the field with respect to the orbital plane. The solutions of the equations of motion have the form: $x_k(\psi) = a_k \psi_k + a_k^* \psi_k^*$, where ψ_k and ψ_k^* are two linearly independent solutions of the equations of motion

Card 1/3

Passage through ...

without perturbation term, and the coefficients a_k and a'_k are determined by the method of "variation of constants". The functions ψ_k have the following structure:

$$\psi_k(\vartheta) = f_k(\vartheta)e^{ikd\vartheta}, \quad f_k(\vartheta + 2\pi) = f_k(\vartheta). \quad \text{True resonance occurs in the cases: } 3\nu_{r,z} = k/M \text{ and } 2\nu_{r,z} + \nu_{z,r} = k/M \quad (M = \text{number of periodic sectors})$$

The author gives estimates on the increase in amplitude, particularly for radial oscillations in a single passage through the region of square resonance. In this region, expansion in the following series is possible:

$$\psi(\vartheta) = \psi_{\text{res}} + \left(\frac{d\psi}{d\vartheta} \right)_{\text{res}} (\vartheta - \vartheta_{\text{res}}) + \frac{1}{2} \left(\frac{d^2\psi}{d\vartheta^2} \right)_{\text{res}} (\vartheta - \vartheta_{\text{res}})^2 + \dots . \quad \text{In the}$$

case $\psi'_{\text{res}} \neq 0$, a rough estimate on the mean value of the increase in the amplitude factor gives:

AUTHOR: Simonyan, Kh.A.
TITLE: Focusing properties of a spiral magnetic quadrupole lens
PERIODICAL: Fizika i tekhnika eksperimenta, no.3, 1962, 27-29
TEXT: An analysis is given of the motion of a charged particle in a magnetic field with a gradient whose hodograph takes the form of a spiral. The general equations for the transverse motion are derived and solved on the linear approximation. On this approximation the field is identical with the field of a quadrupole lens with hyperbolic poles in each $z = \text{const}$ section. The field can therefore be produced by a spiral quadrupole lens whose characteristic property is the absence of instability bands in the region of stable motion. A study of the stable-motion trajectories has shown that this type of lens has double focusing properties but possesses considerable astigmatism. ✓B

SOURCE: Zhur. eksper. i teoret. fiz., v. 45, no. 2, 1963, 173-176

TOPIC TAGS: spin flip, anomalous precession frequency, magnetic moment, electron, muon

ABSTRACT: It is shown that resonance spin slip can be induced in a particle rotating in a constant magnetic field by a weak high-frequency radial or azimuthal magnetic field of frequency equal to the anomalous part of the spin-precession frequency. Resonance spin flip is of interest because it can increase by some 700 times the accuracy with which the magnetic moments of electrons and muons can be measured by the high-frequency method, and the author shows that the perturbation frequency need not be equal to the entire precession frequency, but only to its anomalous part. BtlAUTHOR: Simonyan, Kh. A.

TITLE: Acceleration of polarized particles in cyclic accelerators

SOURCE: International Conference on High Energy Accelerators. Dubna, 1963.
Trudy. Moscow, Atomizdat, 1964, 915-918

TOPIC TAGS: high energy accelerator, electron polarization, electron accelerator

ABSTRACT: The possibility of the acceleration of polarized particles has been discussed in the West (Froissart, Stora, R. Nucl. Instrum. & Methods (1960); Lobkowicz, Thorndike, Rev. Sci. Instrum. (1962); Cohen, ibid. (1960)). It was shown that the injected beam with initial orientation of spin along the magnetic field H_0 in the process of acceleration passes through depolarizing resonances for energies E determined by the equation

$$G \frac{E}{mc^2} = N_1 + N_2\mu_z + N_3\mu_r + N_4\mu_\phi,$$

where $\mu_{r,z}$ is the number of free oscillations each revolution; $G = (g-2)/2$; g is the gyromagnetic ratio; and N_i are integral numbers. In the present work the author

Card 1/3

L 2156-66

ACCESSION NR: AT5007963

discusses the depolarizing effects in electron accelerators with soft and rigid focusing, in synchrotron-accumulators, and also in proton nonlinear-focusing phasotrons. Investigating the classical relativistic equation for the 4-component spin vector (Bargman, et al., *Phys. Rev. Lett.*, 2, 435, (1959)), the author found that the main resonances in the machines arise because of the radial component of the magnetic field: $H_r = H_0 \left(h(x) - \frac{n}{q} z^2 \right)$.

where

$$h(x) = \frac{\Delta H_r}{H_0}; \quad q = \frac{eH_0}{pmc^2};$$

Here ΔH_r are the characteristic perturbations of the magnetic field; P is particle momentum in units of mc ; h is the magnetic field drop index; x is the coordinate along the motion; z is the deviation from the orbit plane. For particle beams these resonances can be resolved in two types: a) noncoherent resonances arising because of free z -oscillations, and b) coherent resonances arising because of characteristic perturbations of the magnetic field and the forced z -oscillations connected with them. During passage through these resonances the following occur: in the first case depolarization, and in the second case change of direction of particle polarization, which the author calls respectively effects of noncoherent

Card 2/3

L 2156-66
ACCESSION NR: AT5007963

and coherent depolarization. The calculations are conducted for a single particle, after which the results are generalized to the case of a beam. In conclusion it is noted that complete beam depolarization occurs in the synchrotron-accumulators and the nonlinear-focusing phasotron, and that it is possible to accelerate polarized particles in the electron accelerator with rigid focusing. It is impossible to avoid here uncontrollable coherent variation of beam polarization, which can, however, repeat from cycle to cycle. Coherent variation in the polarization can be corrected if the perturbation repeats from cycle to cycle with a certain indicated accuracy. "The author thanks Yu. F. Orlov for his valuable comments." TITLE: Preparative method for diphenylbis(trifluoromethyl)methane-4,4'-dicarboxylic acid, Class 12, No. 179764

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 6, 1966, 27

TOPIC TAGS: fluorinated organic compound, carboxylic acid

ABSTRACT: An Author Certificate has been issued for a preparative method for diphenylbis(trifluoromethyl)methane-4,4'-dicarboxylic acid. The method involves the reaction of hexafluoroacetone with toluene in the presence of anhydrous hydrogen fluoride, and subsequent oxidation of the reaction product with dilute nitric acid. [SM]

TITLE: Kinetics of acoustic drying of capillary porous materials

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 9, no. 6, 1965, 741-743

TOPIC TAGS: quartz, acoustic effect, polyurethane, drying

ABSTRACT: The kinetics of acoustic drying were studied on quartz sand the bulk of which (88.3%) consisted of particles 0.355 - 1 mm in size, and contained moisture in the proportion of 0.164 kg/kg. The samples were subjected to various levels of sound pressure (158, 163, and 167 db) at 7 - 15 kc, then analyzed for their moisture content. At the same time, the temperature distribution over the samples was measured with thermocouples. The drying curve was found to consist of three portions: (1) a period of increasing drying rate, (2) constant rate, (3) decreasing rate. Another material studied was polyurethane foam, a material of high moisture absorption coefficient (up to 800%). It was dried at

UDC: 66.047.59

Card 1/2

L 15955-66

ACC NR: AP6001998

sound pressure levels of 155, 165, 167, and 169 db. The drying rate was found to be greatly accelerated by the increasing sound rate. The moisture is eliminated not only by evaporation, but also by mechanical expulsion: dripping was observed at 169 db. The experiments show that in comparison with other methods, the acoustic method permits a several-fold acceleration of the drying process and a simultaneous lowering of the temperature of the material. TITLE: Combined acoustical and high frequency drying of capillary-porous materials

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 10, no. 4, 1966, 542-544

TOPIC TAGS: drying, high frequency, acoustic effect, thermocouple, HF vibration

ABSTRACT: The experimental apparatus (diagram shown) consists basically of a gas jet heater, a chamber, and a modernized high frequency generator. The capillary-porous material investigated was a cylindrical plastic plate with a diameter of 110 mm and a thickness of 24 mm, and a moisture content of 0.28 kg/kg. Thermocouples were inserted into the sample to a depth of 40 mm. Measurements were made of the weight loss and the temperature in three layers of the sample. The parameters of the acoustical field were a sound pressure of 168 decibels and a frequency of 7 kilocycles. The high frequency generator had a voltage on the electrodes of 0.6 kilovolts at a frequency of

Card 1/2

UDC: 66.047

L 29851-66

ACC NR: AP6012685

40.68 megacycles. Combined drying was carried out under exactly the same conditions. Experiments carried out under different drying methods show that the combined method makes it possible to increase the drying rate by 30-90% compared with the acoustical method and by 60-30% compared with the high frequency method. Orig. art. has: 2 figures and 1 table.
