TITLE: An electrolyzer for producing high melting metals from molten mediums. Class 40, No. 177085/announced by State Scientific Research and Design Institute of the Rare Metals Industry (Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut redkometallicheskoj promyshlennosti)

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 74-75

TOPIC TAGS: electrolytic cell, electrolytic extraction, metal electrolytic deposition, metal purification

ABSTRACT: This Author Certificate presents an electrolyzer for obtaining high melting metals from molten mediums. The electrolyzer is in the form of an air-tight chamber with a cutting element for the cathode precipitate. The chamber has a cathode and a circular anode (see Fig. 1). The electrolyzer produces a dense cathode precipitate suitable for electric slag melting. The cathode of the

Fig. 1. 1 - electrolyzer chamber; 2 - die; 3 - shaft of punch; 4 - cutter; 5 - cross arm.

electrolyzer is a tubular cylinder mounted in the lower part of the electrolyzer. A die is mounted in the cavity of the cathode cylinder and is used for pressing out the cathode precipitate. The electrolyzer is provided with a device for pressing out the cathode precipitate. This pressing device is in the form of a punch fastened to a shaft. The shaft is connected to a cross arm which moves in a vertical plane. The electrolyzer is also provided with a cutting element for cutting the cathode precipitate. This cutter is mounted on the shaft of the punch and is connected with the drive mechanism. Orig. art. has: 1 figure.

TITLE: The problem of analytical determination of optimum parameters for atomic power plants by the base point method

SOURCE: Teploenergetika, no. 6, 1964, 22-26

TOPIC TAGS: similarity theory, atomic power plant, atomic reactor, nuclear reactor, atomic electric power plant

ABSTRACT: To obtain high economy of operation of an atomic power plant, the authors examined a means of selecting optimum parameters corresponding to minimum theoretical costs for electrical energy in kopecks/kwh. By using the base point method, a system of approximations was developed which made it possible to obtain simple analytical relationships capable of being refined by further calculation. The basic approach consists in replacing the numerous specific cost indices with generalized, dimensionless complex variables characterizing the technico-economic relations in the base point. These variables also contain cost reducing coef-

"Means of Reducing the Occupational Incidence of Brucellosis,"
by S. M. Smirnov, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 10, Oct 56, pp 86-90

"Analysis of incidence statistics for brucellosis among various groups shows that 75% of the yearly incidence of brucellosis [in the USSR] occurs among workers on animal husbandry farms, sovkhozes, and kolkhozes, and in enterprises processing animal products.... Although the number of cases of brucellosis is comparatively low, the loss of work time due to incapacitation by brucellosis on stock-breeding farms and in enterprises processing animal products is very high. Thus, for example, in 1953 the loss of time from incapacitation due to brucellosis compared with the loss from all other diseases, was as follows on stock-breeding sovkhozes: in the Kazakh SSR, 37% in the Kirgiz SSR, 23%; in the Uzbek SSR, 19%; in Rostovskaya Oblast, 16.8%; and in Stalingradskaya Oblast, 13%. In meat combines work loss attributable to the same cause accounted for 3-9% of the total number of days lost due to all diseases. These figures do not completely reveal the serious damage which brucellosis does to the health of workers. The exhaustive nature of this disease, its refractory and prolonged course, frequent exacerbations, relapses, serious complications, and the absence of a radical method of treatment often lead to partial or complete loss of work capacity. Hardly any other infectious disease of occupational origin is the cause of such a high percentage of temporary and permanent invalidism."

It is then shown that "one of the main deficiencies in the work of the public health organs in controlling brucellosis is the fact that prophylactic vaccination and other preventive measures are instituted in an area only after the disease has broken out, and then only in places where cases have occurred." This is apparent since "the incidence of the disease has decreased on farms where cases have occurred and increased on farms where no cases have been reported previously.... New brucellosis foci and flare-ups in old foci continue to occur in the Central Asian republics and in many oblasts of the RSFSR. It must be taken into consideration that the organs of the veterinary service, for all practical purposes, are still in no condition to guarantee the protection of disease-free farms against the introduction of infection or to immediately detect an incipient epizootic.... In regions considered enzootic for brucellosis, any stock-raising farm can be considered a potential brucellosis focus."

"According to the data of the Rostov, Saratov, Stavropolsk, Chkalov, and other antibrucellosis stations, if vaccinations are carried out in the prescribed manner and at the right time, the incidence of brucellosis among persons vaccinated will be '5-6 times' lower than among unvaccinated persons. It would appear that a sharp reduction in the incidence of brucellosis among the population of these oblasts could be expected. However,

this has not occurred; in fact, under ideal conditions, the actual reduction in incidence in any given oblast has not exceeded 50-60%. Two basic factors make it difficult to obtain the effect which might be expected to follow the prophylactic vaccination of workers and officials on stock-raising farms: (a) the incomplete and untimely nature of the vaccination of permanent, and especially returning and temporary workers, in active brucellosis foci, and (b) the unjustified prohibition of vaccination on so-called unthreatened animal husbandry establishments, where by decrees and instructions issued by the Ministry of Health USSR prophylactic vaccinations can be carried out only on individual farms, and then, strange to say, only after cases of brucellosis have occurred on them among workers or officials."

"The present method of prophylactic vaccination consisting of the subcutaneous injection of the dry live vaccine of the Institute imeni. Gamaleya suffers from a serious deficiency: the technique of administering it is extremely complicated and labor-consuming, making extensive use of this method difficult. In addition, there is a second deficiency which reduces the epidemiological effectiveness of the subcutaneous method of vaccination: about 65% of those vaccinated exhibit a positive allergic reaction at the time of their next regular revaccination and are therefore not revaccinated even though their vaccine immunity has already been partially or completely lost. Thus, these persons are unprotected against large doses of the pathogen during the extremely dangerous calving and lambing periods. An areactive cutaneous method of vaccination which does not have the aforementioned deficiencies has proved to be completely reliable and immunologically effective for humans, according to research carried out by N. F. Zenkova under the direction of Prof I. K. Karakulov. Practicality dictates that a change-over to this method of vaccination be made even though its epidemiological effectiveness is no greater than that of the subcutaneous method. It is the immediate task of the scientific research institutes to put at the disposal of practicing physicians a reliable, simplified, areactive method of vaccination."

"Prophylactic vaccination, which is the fundamental and foremost method used by medical workers in the arsenal of antibrucellosis measures, is, unfortunately, not a radical method of controlling this infection as are, for example, vaccinations against small pox and tularemia."

The report concludes with a discussion of insurance compensation to persons incapacitated by brucellosis and says that existing laws afford the trade unions a means of forcing the managers of stock-raising farms and meat combines to comply with instructions and directives concerning the control of brucellosis.

SMIRNOV, S. M.

"An Occupational Outbreak of Tularemia Among the Workers in a Meat Combine," by S. M. Smirnov, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, Vol 27, No 9, Sep 56, pp 37-43

An unusual outbreak of tularemia in October and November 1954 among workers of one of the meat-preserving combines in the Transcaucasus is described. A brief history of this outbreak, including clinical symptoms and initial diagnoses of malaria, influenza, and brucellosis, is given. Negative results from various tests and the presence of bubos characteristic for tularemia led to the final diagnosis, which was confirmed by isolation of cultures of the pathogen. After prophylactic vaccination (27 and 28 Oct) against tularemia, new cases of the disease subsided sharply among the workers and had disappeared by 9 November.

Characteristics of the outbreak and clinical forms assumed by the disease in several cases are described. An epidemiological analysis of the etiology of outbreaks observed and data from experimental investigations led to the following conclusions:

1. Under definite though not yet studied conditions among sheep, an acute epizootic of tularemia can arise; the sheep then become a dangerous source of mass infection of workers in meat combines and slaughterhouses.

2. Sheep infected with tularemia present a great danger during the period of generalized infection, which lasts from the second day after infection to the fifth or sixth day and proceeds without visible clinical manifestations.

3. The basic mechanism of transmitting infection in meat combines is contact with the blood or lymph of sheep suffering from tularemia during the period of bacteremia.

4. The probability of human infection is diminished after removal of the blood from the sheep and especially after rigor mortis sets in. As a result of this, the degree of danger from commercial meat and by-products is sharply decreased.

5. Vaccination against tularemia, which is the most radical prophylactic method, should be obligatory for workers in meat combines and slaughterhouses located in areas which have natural foci of this infection.

PURPOSE: This book is intended for specialists in the field of machine and instrument manufacture who use radioactive isotopes in the study of materials and processes.

COVERTEXT: This collection of papers covers a very wide field of the utilization of tracer methods in industrial research and control. The topic of this volume is the use of radioisotopes in the machine and instrument manufacturing industry. The individual papers discuss applications of radioisotope techniques in the study of metals and alloys, the detection of corrosion, metal cutting, engine performance, and defects in lubrication. Several papers are devoted to the use of radioisotopes in the automation of industrial processes, recording and measuring devices, quality control, flowmeters, level gauges, safety devices, radiation counters, etc. These papers represent contributions of various Soviet institutes and laboratories. They were published as Transactions of the All-Union Conference on the Use of Radioactive and Stable Isotopes and Radiation in the National Economy and Science, April 4-12, 1957. No personalities are mentioned. References are given at the end of most of the papers.

TITLE: Approximate method of analysis of self-oscillations in two-position regulating system

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 5, 1962, abstract 6-2-133 v (Nauchn. tr. Mosk. tekhnol. in-t legkoy prom-sti, no. 18, 1960, 167-178)

TEXT: The self-oscillations of two-position regulating systems are investigated. Systems are considered the relay element of which has hysteresis and dead zone. The controlled condition is a first-order factor. An approximate method is suggested for solving the transcendental equations that determine the self-oscillation period, by replacing exponential transient characteristics by secant characteristics. Computation formulas are derived for the cases of presence or absence of a pure delay. [Abstractor's note: Complete translation.]

tekhnol. in-t legkoy prom-sti, 1961, no. 19, 135-146)

TEXT: The author gives the analysis of the transient process during charging of capacitance from AC mains with the aid of half-wave and full-wave rectifiers. The analytical calculation is performed using a method developed by the author. It is assumed that the charge on the capacitance has been collected during a large number of AC cycles. Computational relations, curves and approximate formulas are presented, from which it is possible to determine the time of voltage rise across the capacitance as well as the steady-state value of the voltage. 4 references. TITLE: Equation for the average value of a controlled coordinate in an object having distributed parameters

SOURCE: Avtomatika i telemekhanika, v. 25, no. 1, 1964, 136-139

TOPIC TAGS: automatic control, long line type plant, average value automatic control

ABSTRACT: A process in an object with a single-dimensional distribution of parameters (charge in a long RC line, heating a long rod, etc.) can be described by this Fourier's approximate differential equation: $\frac{\partial^2 u(x, t)}{\partial x^2} = T_0 \frac{\partial u(x, t)}{\partial t}$, where u is the controlled parameter, x is a spatial coordinate, and T_0 is the specific time constant. A solution of this equation is investigated: average value of the

Card 1/2

ACCESSION NR: AP4011323

parameter in the object is determined; the transfer function, which connects this average value with the step impulse applied to the origin of the line, is set up; the frequency characteristic and transient response curve are plotted; exactly computed and approximately determined characteristics are compared. The conclusion is drawn that, with small ωT , the variation of the controlled parameter at a point on the line lying at 0.42 from the origin is close to the variation of the parameter's average value. A sensor installed at this point would be able to control the average value of the parameter Orig. art. has: 4 figures and 10 formulas.

TITLE: Transfer function of a system with distributed elements for the mean value of a parameter

SOURCE: Ref zh. Kibern, Abs. 1G31

REF SOURCE: Nauchn. tr. Mosk. tekhnol. in-t legkoy prom-sti, vyp. 31, 1965, 239-246

TOPIC TAGS: function analysis, parametric equation, circuit theory

ABSTRACT: A simplified equation for the mean value of a parameter is composed with respect to systems in which the process can be described by the unidimensional Fourier equation. It is shown that exact and approximate frequency and transient characteristics are close over a sufficiently broad frequency range. The coordinate of a point whose parameter is close to the mean is determined. It is pointed out that a change in the coordinate of the control point takes place during the transient process, but the extent of this change is limited. The transfer function of a circuit is given on taking into account initial resistance. It is pointed out that systems with distributed elements the theory of lumped-element network may be em-

High-voltage pulse generators (Generatory impul'sov vysokogo napryazheniya) Moscow, Izd-vo "Energiya," 1964. 0238 p. illus., biblio. 6,500 copies printed

TOPIC TAGS: pulse generator, electric engineering, pulse shape, electronic circuit, resistor, capacitor, test, test method

PURPOSE AND COVERAGE: This book describes methods of analysis and synthesis of discharge circuits by the transient processes of a generator taking into account its self inductance and the inductance of the test element. Damping factors of oscillation at pulse fronts and tail ends are admitted as additional shape characteristics of third and fourth order pulses, and nomographs and tables of pulse shape parameters based on analysis and on technical specifications are included. Experimental results of the charging process with rectified voltage, methods for calculating resistances of charging and discharging circuits of varied design, and a method for controlling discharge circuit tuning to a given pulse shape by experimental

frequency characteristics are also included. The book is intended for engineers and technical personnel concerned with the design and operation of high-voltage pulse generators, as well as for students at institutes offering courses in electrical engineering. The authors thank Prof. L.I. Sirovinskiy for his interest in this work and for valuable comments on the manuscript, and Docent G.M. Goncharenko for editing the manuscript.
