TITLE: Automatic equipment for measuring the radiation field
of a reactor

PERIODICAL: Jaderná energie, no. 6, 1962, 181 - 184

TEXT: The article describes design and function of an automatic equipment developed by the Reactor Laboratory of the Ústav jaderného výzkumu, ČSAV (Nuclear Research Institute, Czechoslovak AS) for mapping the field of nuclear radiation emanating from the horizontal experimental channels of a nuclear reactor. The equipment consists of a movable triangular T-frame under-carriage with two vertical 220 cm high guide rails. These rails support the carriage of the measuring probe (scintillation detector) which can be lifted 180 cm high and automatically lowered in steps of 5 cm. The movement of the probe carriage is controlled according to a preset program or from a remote control box, the servomotor driven undercarriage has four horizontal speeds in the range of $4.9 \cdot 10^{-2}$ to 0.37 cm/sec. and can also be remotely controlled. End-contacts, spaced 10 - 400 cm actuate the Card 1/2

lowering of the probe and reversal of servomotor rotation, so that a section of $400 \cdot 180 \text{ cm}^2$ can automatically be mapped. The described equipment was used to measure the cross sections and axes of radiation beams emanating from horizontal experiment reactor channels, to measure the efficiency of collimators, to determine gamma doses in dependence of gamma background and their distribution in the environment of removed thermal columns, and for conventional dosimetric measurements. In addition, the instrument can also be used to map the radiation field of an arbitrary radioactive source, especially in cases where complex radiation fields cannot be mathematically derived from few dosimetric reference measurements. The author gives credit to J. Šimerda for assistance in measurements performed. (Technical Editor: M. Čapek, and Fr. Musílek). There are 7 figures. X

Red anilines. II. α -Oxo- γ -(3,4,5-trimethoxyphenyl)- and α -oxo- γ -(3,4,5-trimethoxy-2,6-dibromophenyl)butyric

acid. J. Michalský and M. Smej (Univ. Brno, Czech.). *Mohalsh.* 40, 458-02(1959); cf. *C.A.* 54, 4481f.—Cleavage of α -(*p*-dimethylaminophenylimino)- β -oxo- δ -(3,4,5-trimethoxyphenyl)valeronitrile (I) with dil. HCl leads to α -oxo- γ -(3,4,5-trimethoxyphenyl)butyric acid (II), and not, as previously reported (*loc. cit.*), to 3-hydroxy-4,5,8-trimethoxyindan-3-carboxylic acid. As proof, α -oxo- γ -(3,4,5-trimethoxy-2,6-dibromophenyl)butyric acid (III) was prepd. by acid cleavage from α -(*p*-dimethylaminophenylimino)- β -oxo- δ -(3,4,5-trimethoxy-2,6-dibromophenyl)valeronitrile (IV). IV, with both reactive hydrogens replaced by Br, easily reacted with *o*-C₆H₄(NH₂)₂ and 2,4-(O₂N)C₆H₃NH-NH₂, and oxidative decarboxylation with H₂O₂ led to β -(3,4,5-trimethoxy-2,6-dibromophenyl)propionic acid (V) with evolution of CO₂. In the same manner, I led to II which, in neutral H₂O₂ soln., split off CO₂ almost quant. to yield β -(3,4,5-trimethoxyphenyl)propionic acid (VI). E.g., Br (3.5 g.) in glacial 10 ml. AcOH was slowly added to a soln. of 2.4 g. VI, kept 2 hrs. at room temp., the excess Br removed with Na₂SO₃, the mixt. dild. with 250 ml. H₂O, and the pptd. cryst. V recrystd. from EtOH, m. 119-20°, yield 3.3 g. Dry C₆H₆ (30 ml.) and 2.5 ml. SOCl₂ were added to 2.3 g. V, dissolved and heated 3 hrs. at 70°, the oily acid chloride dissolved in 10 ml. C₆H₆ and added slowly, with const. stirring, to an Et₂O soln. of CH₃N₂ cooled to -15°, the whole allowed to stand 20 hrs. at -15°, filtered, HCl (gas) added till N evolution ceased, and kept for a while. After washing with H₂O, and drying over CaCl₂, the product was reduced in vol. to yield, after recrystn. from MeOH, 1-chloro-4-(3,4,5-trimethoxy-2,6-dibromophenyl)-2-butanone (VII), white

needles, m. 107-8°. VII (2 g.) was dissolved in 10 ml. dry C₆H₆N, heated 30 min. to 60-5°, and Et₂O added to ppt. the pyridinium chloride as an oil; this was sepd. and poured, with vigorous stirring, into a soln. of *p*-ONC₆H₄NMe₂ (750 mg. in 8 ml. EtOH) and NaCN (500 mg. in 3 ml. H₂O) at 40° to form a deep red mixt. which yielded 1.7 g. IV, m. 170-2° (C₆H₅-EtOH). IV (400 mg.) was split by heating 30 min. to 40° with a mixt. of 10 ml. Me₂CO and 10 ml. 15% HCl. Me₂CO was evapd., the oily α -ketone extd. 3 times with 20 ml. Et₂O, washed with H₂O, the Et₂O evapd. *in vacuo*, the oily remainder taken up in Me₂CO, H₂O and a few drops dil. HCl added, and left to stand several days. III pptd. as shiny mother-of-pearl colored leaves; these dried over P₂O₅, m. 83.5-5.5°. 2,4-dinitrophenylhydrazone, yellow needles, m. 195-7°; and 2-hydroxy-3-[β -(3,4,5-trimethoxy-2,6-dibromophenyl)ethyl]quinoxaline, needles, m. 224-5°. III (42.8 mg.) dissolved in 1 ml. 0.1N NaOH, the soln. brought to pH 7, treated with 0.3 ml. 3% H₂O₂, released in 15 min. an almost quant. amt. of CO₂ (measured volumetrically in a gas microburette), acidified and V, m. 120-1°, recrystd. from EtOH. A mixt. of V and β -(3,4,5-trimethoxy-2,6-dibromophenyl)propionic acid showed no mixed m. p. depression. Similarly, II, prisms, m. 136-7°, yield 80%, was obtained by acid cleavage of I; its 2,4-dinitrophenylhydrazone/deep red needles, m. 211-13°. II was decarboxylated with H₂O₂ as above to yield VI, m. 101-2°, identical in m.p. and mixed m.p. with β -(3,4,5-trimethoxyphenyl)propionic acid. Stefan Berger.

TITLE: Inelastic peripheral collisions at ultra-high energies 5

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 47,
no. 5, 1964, 1736-1739

TOPIC TAGS: inelastic scattering, particle collision, pion scattering, nucleon scattering

ABSTRACT: The asymptotic behavior of inelastic peripheral collisions is considered within the framework of the one-meson approximation. Assuming that the πN interactions at energies above the resonance region are due wholly to exchange of a single pion, the author derives asymptotic expressions for the average inelasticity coefficient and the transverse momentum of the recoil nucleon. It is shown that the distributions of the transverse momentum and of the

Card 1/2

L 14512-65
ACCESSION NR: AP5000323

recoil-nucleon energy are constant in the asymptotic expressions for the cross sections, so that if the cross sections themselves are constant, the inelasticity coefficient and the transverse momentum are constants and their average asymptotic value can be determined from the ratio of the cross sections for NN and π N interactions. Since the values of these cross sections are known (40 and 22.5 mb respectively), the values obtained for the inelasticity coefficients and transverse momentum are 0.36 and 0.47 GeV/c, respectively. Orig. art. has: 1 figure and 12 formulas.

TITLE: On the Problem of Determining Diffusion Coefficients
in Alloys

PERIODICAL: Fizika metallov i metallovedeniye, 1960, Vol. 10,
No. 2, pp. 515 - 516

TEXT: In the experimental determination of the diffusion
coefficient D by the radioactive tracer method, use
is made of the one-dimensional diffusion equation in which
it is assumed that D is independent of the concentration.
In such cases, the solution of the diffusion equation is

$$c(x, t) = c_0 \left(1 - \operatorname{erf} \frac{\lambda}{2\sqrt{D}} \right) \quad (2)$$

where $\lambda = x/\sqrt{t}$. There are clearly cases when this
assumption is invalid and the solution of the diffusion
Card 1/4

32292R

S/126/60/010/002/028/023/KK
EC52/E514

On the Problem of

equation

$$\frac{\partial c}{\partial t} = D \frac{\partial^2 c}{\partial x^2} \quad (1)$$

subject to the boundary conditions $c = c_0$ at $x = 0$
 for all t , and $c = 0$ for $x = \infty$ and all t , is of the
 form (Berrer - Ref. 2)

$$c - c_0 = \frac{\int_0^t \frac{dt}{D} \exp \left[-\int_0^t \frac{dt}{2D} \right]}{\int_0^t \frac{dt}{D} \exp \left[-\int_0^t \frac{dt}{2D} \right]} \quad (3)$$

If it is assumed that D is a linear function of
 concentration, i.e. $D = 2 \bar{D}(1 - c/c_0)$, where \bar{D} is the

Card 2/4

32292R

S/126/60/010/002/023/023/KK
E052/E514

On the Problem of

average value of \bar{D} in the interval $(0, c_0)$, then Eq. (3) can be evaluated by successive approximations and one can obtain $c/c_0(\lambda)$ for a given value of \bar{D} . Fig. 1 shows the c/c_0 curve for $\bar{D} = 10^{-10}$ cm²/sec. Curve 1 is evaluated from Eq. (3) and Curve 2 from Eq. (2). Furthermore, it was recommended by Malkovich (Ref. 1) that \bar{D} should be determined by plotting

$$\ln \left[-d \left(\frac{c}{c_0} \right) / d\lambda \right]$$

as a function of λ^2 . This plot is shown in Fig. 2, in which Curve 1 is computed using Eq. (3) and Curve 2 using Eq. (2). There are 2 figures and 2 Soviet references.

"Staphylococcal Food Poisoning in Krakow."

Warsaw, Przegląd Epidemiologiczny, Vol 19, No 2, 1965; p 246.

Abstract: During 1953 to 1959, there were 2 outbreaks of Staphylococcal food poisoning in the Krakow involving 67 persons; in 1960 to 1964, 10 outbreaks with 244 patients. In 10, Staphylococcus aureus (coagulase-positive) was identified, in one Staphylococcus albus coagulase-positive and in one staphylococcal enterotoxin. Ice cream was the food involved in 4 cases, meat products in 4, dairy in 3 and egg-paste in one. Indications are that some strains of coagulase-positive Staphylococcus aureus may survive pasteurization. Presented at the 3rd Scientific Assembly of Polish Epidemiologists and Infectologists, 5-6 Oct 64. [JPRS]
