

SOFIANO, T. S.

USSR/Geology - Historical dates

Card 1/1 Pub. 46 - 15/21

Authors : Tixhomirov, V. V.; and Sophiano, T. S.

Title : From the history of geological sciences

Periodical : Izv. AN SSSR. Ser. geol. 20/2, 129 - 134, Mar-Apr 1955

Abstract : Some historical occurrences are recalled with explanations as to their bearing on the development of geological science. The dates are: founding of the M. V. Lomonosov University in 1755; death of Academician I. G. Gmelina in 1755; birth of the British geologist Adam Sedgwick in 1785; founding of the "Gornyy Zhurnal" (Mining Journal) in 1825; birth of the paleontologist and geographer Ivan Dement'yevich Cherskiy in 1845; birth of Academician Paul Ivanovich Stepanov in 1880; death of Paul Apollonovich Tutkovskiy in 1930; organization of the Moscow Geological-Research Institute in 1930; death of Academician Andrey Dmitriyev Arkhangel'skiy; and death of Alexander Yevgen'yevich Fersman in 1945. Two USSR references (1948-1953).

TITLE:

"Commemorating the 250th Anniversary of the Birth of the Swedish Naturalist K. Linné" (Dvesti pyat'desyat let so dnya rozhdeniya shvedskogo yestestvoispytatelya K. Linneya)

PERIODICAL:

"Izvestiya Akademii Nauk SSSR", Seriya Geologicheskaya, 1957,
No. 7, p. 109, (USSR)

ABSTRACT:

Karl Linné, 1707-1778, was born in Rosshult (Sweden). After graduating from the Upsala university in 1734 he received the degree of a Medical Doctor in Holland the following year. Linné concentrated his efforts on the study and classification of the flora, and described approximately 1,500 new kinds of different plants. He was one of the founders of the Stockholm Academy of Sciences and its first president.

of N.G. Meglitskiy" (Sto let so smerti N.G. Meglitskogo)

PERIODICAL: "Izvestiya Akademii Nauk SSSR", Seriya Geologicheskaya, 1957,
No. 7, pp. 111-112, (USSR)

ABSTRACT: Nikolai Gavrilovich Meglitskiy (1825-1857) graduated from the
Institute for Mining Engineers at St Petersburg in 1846. He
was engaged in geological surveying work at different territ-
ories of the Urals and Siberia. Besides, Meglitskiy was
interested in geothermics, and conducted temperature research
in deep mining pits. He was active member of the Siberian
Department of the Russian Geographic Society.

TITLE: An X-ray Structural Phase Analysis of the System
Zr-H i Ti-H (Rentgenostrukturnyy fazovyy analiz
sistem Zr-H and Ti-H)

PERIODICAL: Kristallografiya, 1958, Vol 3, Nr 5, pp 539-544 (USSR)

ABSTRACT: The Zr-H and Ti-H systems have been investigated by Hägg (Z. Phys. Chem., Vol 11, p 433, 1931). In the Zr-H system, he established five phases: Zr (alpha phase); a cubic face-centred beta phase with $a = 4.664 \text{ \AA}$ and composition near Zr_4H ; near Zr_2H a hexagonal phase, gamma, with a large cell; near ZrH a face-centred cubic delta phase with $a = 4.77 \text{ \AA}$; and at ZrH_2 a tetragonal epsilon phase. In the Ti-H system, there were only two phases, the metal up to 33 atm. % H and a beta phase with a face-centred cubic structure and composition range 50-62.4 at % H. Except for ZrH_2 , in which Hägg thought pairs of H atoms occurred in octahedral vacancies, all H atoms were thought to be in tetrahedral sites.

Card 1/3 For the present investigation Zr foil 30-40 μ thick and

SOV/70-3-5-2/24

An X-ray Structural Phase Analysis of the System Zr-H and Ti-H

powdered Ti were used (99% purity). Diffraction pictures were taken in a 57.3 mm dia camera with unfiltered Fe radiation. V and Ti anodes were used for the Ti system. For the Zr system, the α -phase contained up to 10% H with a hexagonal cell with $a = 3.23$ and $c = 5.14$ Å. The β -phase ($a = 4.76$) appeared at 18% H but the α -phase continued to appear up to 58% H. The β -phase was found to be homogeneous between 60 and 62% H and was replaced by a tetragonal distortion above 62%. At 65%, the cell had $a = 4.97$ and $c = 4.44$ Å and at 63.5% $a = 4.90$ and $c = 4.53$ Å (in each case ± 0.005 Å). The other observations of Hägg were not confirmed. The Ti metal phase had the hexagonal alpha structure with $a = 2.95$ and $c = 4.70$ Å. At 55.2 atm % H, the β -phase had a face-centred cubic structure with $a = 4.39$. Between 25.0 and 41.5%, both phases were observed. At 60% the 002, 022 and 113 reflections of the β -phase began to broaden and at 64.3%, a tetragonal distortion became apparent where $a = 4.45$ and $c = 4.35$ Å. The very strong 111 reflection from the cubic β -phase coincides with the 100 reflection from the hexagonal α -phase.

Card2/3

SOV/70-3-5-2/24

An X-ray Structural Phase Analysis of the System Zr-H and Ti-H

The results obtained agree with those of Sidhu and McGuire (J.App.Phys, 1952, Vol 23, p 1257) who studied the Hf-H system which the two systems studied here resemble.

TITLE: Investigation of the Density Distribution in the Detonation
Front of Gas Mixtures by the X-Ray-examination Method
(Issledovaniye raspredeleniya plotnosti vo fronte detonatsii
gazovykh smesey rentgenograficheskim metodom)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 6,
pp 1292-1293 (USSR)

ABSTRACT: The investigation mentioned in the title was begun in 1945,
but had to be interrupted because of the illness and death of
M. A. Riven. It was resumed in 1957. The method employed in
the present investigation uses a needle-shaped pulse tube
(Ref 10) with zirconium anode as a source, and krypton, which
is added to the detonating gas, as an absorbing medium. The
characteristic radiation of zirconium ($\lambda_{K\alpha} = 0.788 \text{ \AA}$) incides
upon the absorption band of krypton. This combination made
it possible to detect density variations in relatively thin
layers of gas mixtures. The main result is that a thin layer

Card 1/2

Investigation of the Density Distribution in the SOV/20-125-6-33/61
Detonation Front of Gas Mixtures by the X-Ray-examination Method

of gas, with a density that is from three to four times that of the original density, was found to exist in the front of the detonating wave. Figure 1 shows the density distribution in pure krypton and in the detonating wave of a mixture of detonating gas and krypton. The authors thank N. N. Orlova for her collaboration, Ye. I. Leont'yeva for taking part in the experiments of 1945, and R. M. Zaydel' for his assistance in carrying out calculations. There are 1 figure and 10 references, 4 of which are Soviet.

TITLE: Equilibrium State of the Ti - H and Zr - H Systems at
Low Pressures

PERIODICAL: Zhurnal fizicheskoy khimii, 1960, Vol. 34, No. 5,
pp. 1104-1109

TEXT: When accelerating substances with metal targets saturated with hydrogen isotopes are used, it is necessary to know the permissible temperature that does not reduce the efficiency of the targets. Since the existence of a "metal - hydrogen" equilibrium has hitherto not been investigated at pressures of less than 10^{-3} torr, the systems Ti-H and Zr-H were examined at pressures of 10^{-3} to 10^{-7} torr in the article under review. The metals were saturated with hydrogen by a method described in Ref. 6 until they had almost attained the composition of MH_2 . The hydrogen concentration (Table) and the dependence of equilibrium pressures on temperature, respectively, were determined in metal hydrides

Card 1/3

Equilibrium State of the Ti - H and Zr - H
Systems at Low Pressures

S/076/60/034/05/27/038
B010/B003

by means of a pressure gauge with an $\text{AM}-2$ ($\text{LM}-2$) ionization tube and an $\text{AT}-2$ ($\text{LT}-2$) thermocouple pressure gauge. From these dependence curves the isobaric and isothermal lines (Figs. 2-5) were drawn. The experiments showed that there is an equilibrium state in the systems investigated at pressures of 10^{-3} to 10^{-7} torr. The system Zr-H is thermally more stable at low pressures with respect to hydrogen separation than the system Ti-H. The reaction heat of the hydride formation of Ti and Zr is not constant, and its temperature- and pressure dependences vary with the hydrogen content of the metal. The heat of formation of titanium hydride increases from 19 to 44 kcal/Mol and that of the zirconium hydride from 29 to 42 kcal/Mol. The authors assume that three different processes take place: 1) Dissolution of hydrogen in the α -phase of the metal, 2) transition of the α -phase into the β -phase (hydride formation), and 3) dissolution of hydrogen in the β -phase. In conclusion, the authors thank V. A. Tsukerman, Doctor of Technical Sciences, Ya. B. Zel'dovich, Corresponding Member of the AS USSR, and V. A. Davidenko, Doctor of Physical and Mathematical Sciences, for their valuable advice. There are 8 figures, 1 table, and 7 references: 3 Soviet, 2 American, and 2 English.

TITLE: On the Antitumoral Action of Sarcolysine Peptides. (O Protivo-opukholevom deystvii peptidov sarkolizina)

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol 114, Nr 5, pp 1070-1072
(U.S.S.R.)

ABSTRACT: There exist at present already some synthetic preparations with alkylating action that possess strong antitumoral properties. They have however essential defects. In the first place they are effective only in the case of tumors or tumor-like diseases of the hematopoietic system. Those which act on real tumors (sarcolysine, TEF) only influence a very limited number of them. The second deficiency is that they possess considerable toxicity and are therapeutically active only in the highest endurable doses. This indicates little selectivity of their action on tumors. The basic idea of the preparation of sarcolysine, which, among the existing preparations is apparently the most selective against some types of tumors, was: to utilize the metabolites, especially amino acids, as "carriers" of the alkylating group and their "introducer" to the tumors. There seems to exist a possibility to obtain new preparations by replacement of the "carriers" of chloroethylamine groups by others. In this direction a new way is indicated by this work. It is a matter of addition of a second metabolite by the amide linkage to the "primary carrier" of the chloroethylamine group, especially of a second amino acid. The following peptides of sarcolysine were synthesized: 1) N-formyl-sarcolysyl-phenylalanine-ethylether, 2) N-formyl-sarcolysyl-valine-ethylether and

Card 1/3

20-5-42/60

On the "ntitumoral Action of Sarcolysine Peptides.

3) N-formyl-sarcolysyl-tryptophane-methylether. All these compounds which are not easily dissolved in water proved to be only slightly toxic. Tab. 1 shows that the two first of the studied substances exercise an antituberculous influence sarcoma on mice and rats which equals that of sarcolysine. By microscope no tumor cells were detected in the small nodes which were on the places of the tumors. At the same time body-weight decreases to some extent as a result of a sarcolysine cure, while this was not the case in the peptidetests. Histological investigation of the animals killed after the test neither showed changes in intestines or marrow, nor marked splenic stropy. The third compound (--methylether) proved to be inactive. It may be assumed that the high selectivity of the action of peptides finds expression only if they contain the corresponding peptidases when penetrating into the tumoral tissue. By influence of the latter a cleavage takes place in the peptide, and sarcolysine as the active part of the preparation is liberated. The data on enzymatic hydrolysis of the amide linkage of the simplest amides of aromatic chloroethylamines seem to indicate this possibility. From this standpoint the lacking action of the preparations on the hematogenic organs may possibly be explained by the weak activity of the corresponding enzymes in them. The different power of action of one and the same preparation and different tumors may possibly be explained in some extent by the different activity of corresponding peptidases in them. In a similar manner the activity of compound 3

Card 2/3

20-5-42/60

may be explained against the tumors investigated.

Orig Pub : Byul. Vses. in-ta rasseleniyevodstva, 1957, No 3, 42-

Abstract : In the study of the flax seed collection at the All-Union Institute of Horticulture it was established that the strongest tendency to the boll formation in six or more bunches is found in the long-flowered flax variety Fertilnik, and especially in hybrids derived from this variety. As the result of repeated selections plants were obtained having 60-70% of six-bunch bolls (pods) at the race 4. In the succeeding generation of furt or increase race 4.

TITLE: Ionospheric current system of the initial phase of the geomagnetic storm on 4 September 1957

SOURCE: Geomagnetizm i aeronomiya, v. 6, no. 6, 1966, 1126-1128

TOPIC TAGS: geomagnetic disturbance, ionospheric disturbance, ionospheric electron density, MAGNETIC STORM

ABSTRACT: The construction of an approximate equivalent current system for the ionosphere during the initial phase of the geomagnetic storm on 4 Sept 1957 is described. The storm started suddenly at 1300 hr; its initial phase lasted approximately 1 hr and 20 min. Differences in geomagnetic components before and during the initial phase of the storm were calculated from hourly mean values obtained by 39 ground stations for the hour preceding the storm and during its first hour. The daily solar geomagnetic variation S_q was found from these differences. The approximate equivalent current system in the ionosphere (see Fig. 1) was constructed from the above data. A dense current stream of approximately 150,000 a flows in a westerly direction toward the sun above the polar cap along the 9th hour meridian. This

current stream splits to form two rotating current streams, the stronger of which has an intensity of ~120,000 a. Directions, positions, and magnitudes of the current system agree analogically with those of current systems found by other researchers. Orig. art. has: 1 figure. [WA-3] [IV]
