ACCESSION NR: AP5011360

density in sulfuric acid baths due to the passivation of the steel. After the passivity is overcome, the dissolution rate of the steel hardly changes. This initial current increase depends only slightly on the concentration of the sulfuric acid and it decreases for steels of higher chrome content. For steels containing less than 27% chrome when fluoride ions are present, the anodic polarizing curves show a region of slow reduction in current density at voltages where the passivation begins. This reduction depends on the composition of the steel, the concentration of the fluoride ions and the concentration of the sulfuric acid. The region of maximum passivity in solutions with fluoride ions begins at higher voltages than when sulfuric acid is used alone. At positive voltages (0.5-0.6 v), the fluoride ions destroy the passive state and the current density increases, particularly in low alloy steels. With NaF constant concentration the current density decreases in the 0.4 to 0.95 range in more concentrated solutions. Metallographic analysis shows that the dissolution of the tempered steel specimens is uniform, the surfaces remain smooth without pitting. Oxidation of ferrous ions in the presence of fluoride ions on the steel surfaces is low. The effect of fluoride ions on steel corrosion in $10N H_2SO_4 + 3M CrO_3$ solution is more pronounced than that of chloride ions. It is concluded that all halide ions attack the passive state in steel. But the mechanism of the attack by fluoride ions differs from that of the

Card 2/3

L 55134-65

ACCESSION NR: AP5011360

other halides. The Cl^- , Br^- , I^- and ClO_4^- ions attack the steel surfaces spot-wise by pitting and dissolve the iron as ferrous ions. The fluoride ions attack the whole surface at once and dissolve the iron as ferric ions. This assumption is based on the voltages measured when fluoride ions were present. The hypothesis that ferrous ions are first formed and then oxidized to ferric appears to be contrary to the experimental results. It is assumed that the fluoride ions are adsorbed at the steel surface competing with oxygen which is also adsorbed. The affinity of oxygen for the surface increases in high chrome steels which may account for the insignificant effect of fluoride ions on the passivation of these steels. "Concerning the Question of Roentgenological Diagnosis of Myeloma Disease (Rustitskiy Disease)," by Docent A. G. Suntsov and Assistant L. I. Sokolova, Chair of Propaedeutics of Internal Diseases (head, Prof Kh. I. Vaynshteyn) and Chair of Pathologic Anatomy (head, A. I. Vorotilkin, Doctor of Medical Sciences, Chelyabinsk Medical Institute (director, Prof G. D. Obraztsov), Vestnik Rentgenologii i Radiologii, Vol 31, No 3, May/June 56, pp 83-89

In all vague cases of bone affection when the urinary and hemopoietic systems present symptoms of pronounced anemia, myeloma disease should be considered and appropriate studies conducted on the patients.

After sufficient acquaintance with the clinical picture of Rustitskiy Disease (after the Russian O. A. Rustitskiy), and after accurate interpretation of the changes in the skeletal system, the roentgenologist may assume the leading role in recognizing myeloma disease which is difficult to diagnose.

TITLE: Characteristics of regenerative magnetron amplifiers

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 6, 1965, 647-651

TOPIC TAGS: amplifier design, amplifier stage, magnetron

ABSTRACT: Results are given of experiments in using magnetrons as regenerative amplifiers in the 3-cm and 10-cm bands. Several variants of two-pole and four-pole configurations were tried with varied degrees of magnetron loading. Using as graphical coordinates the anode voltage and magnetic field, the authors plot the conditions for pure amplification, as distinguished from the other two possible magnetron modes, i.e., self-oscillation and synchronized oscillation, where amplification is achieved by the magnetron locking on to an applied signal frequency. Optimum gain characteristics were determined while keeping a fixed input frequency and amplitude. As a second step, the amplitude-frequency characteristic was found, in which case magnetron field and anode voltage were held constant. A typical result is shown in the figure for four levels of input power; the gain curve is seen to be the locus of the resonant peaks of the individual frequency characteristics. The curves show that gains of 15—20 db are possible at low input levels. A third step in the program was to measure the phase characteristic

 C - output power; D - levels of input power;
 E - input power, rel. units.

of the magnetron amplifier as a function of anode voltage and input signal level. Results show a phase shift of 1—2° for a 1% shift in anode voltage, 0.5—1° shift for a 1% shift in field intensity, and a 5—10° shift for a 2:1 change in input signal level. It follows that the phase stability of the magnetron amplifier is considerably better than that of a klystron or a TWT. Cascading of magnetron stages was also successfully done, but is only briefly referred to. Orig. art. [SH] has: 3 figures.

ASSIGNMENT: The Goodyear Tire & Rubber Company, Akron, Ohio
PERIODICAL: Kaučuk & Rezina, 1959, No. 7, pp. 40-47
TITLE: On the Application of Dielectric Acceleration to Vulcanization
ABSTRACT: The authors refer to anisotropic derivatives of 2-mercaptobenzoic acid, as being effective vulcanization accelerators of mixtures of natural and synthetic butadiene styrene rubbers. This is achieved by the addition of mixtures of natural and synthetic butadiene styrene rubbers to the mixture of natural and synthetic butadiene styrene rubber. The properties of this anisotropic derivative are described. A representative of the group under discussion, build characteristics, and properties of the accelerators used at present in industry, sulfide D, are described. It is shown that, however, by ensuring a higher rate of vulcanization, the rubber becomes more elastic. Besides, the vulcanizate of dielectric D is difficult to store. The authors also point out that the DCA acceleration does not have many of the shortcomings which the latter accelerators do. They illustrate physical and chemical properties of DCA and specify how it can be obtained in the laboratory. In order to utilize DCA in industry, for tire manufacturing, Card 1/2

duo-scale tests were conducted in the plant. It was shown that the introduction of EVA accelerator into the protective mixtures of butadiene-styrene rubber (ISBR-30 AM), instead of butadiene ECR, and also into the mixture of butadiene- α -methyl and natural rubber had very little effect on the ratio 70/20, containing various types of carbon black, and leads to the production of vulcanizates equal to those with sulfonated ECR in their physico-mechanical properties. An experimental batch of tires was produced using the EVA accelerator in the protective mixture. The technical properties of this protective rubber, according to static and dynamic test data, and according to the durability of the tire cutting under conditions of rolling, tests are actually equal to those of the control rubber, containing the ECR accelerator. As a result of the obtained protection, the number of segments until side-wall tests were carried out on the first acceleration in protective rubber instead of on the rubber with the ECR accelerator, in several times increasing plants. There are 6 sets of 5 tires, a technical and service performance association: Novosibirsk Shchitnyi завод, Nizhniy Novgorod, Krasnoyarsk, Kamyshin, Rostov-on-Don, Stavropol, and the Scientific Research Institute of the Tire Industry.

USSR/Medicine - Veterinary, Cobalt Chloride Feeding

Card 1/1

Author : Sokolova, L. M., Veterinary Physician

Title : Significance of cobalt for farm animals

Periodical : Veterinariya, 31, 49-53, May 1954

Abstract : Cobalt feeding is significant in the nutrition of farm animals. Prolonged deficiency of cobalt in the diet causes rather characteristic symptoms such as listlessness, retarded development of sexual characteristics, and gauntness due to loss of appetite. Cobalt feeding in small amounts improves the growth and development of young animals, reduces incidence of pulmonary diseases and nutritional anemia, restores appetite, fecundity, and milk production, and improves the quality of wool clip. Above average erythrocyte count and hemoglobin concentration is usually found in farm animals, whose diet is supplemented with cobalt chloride. Illustrations.

TITLE: Investigation of the bactericidal dynamics of *Hyssopus officinalis* L.

SOURCE: Nauchnyye doklady vyshey shkoly. Biologicheskiye nauki, no. 3, 1965, 164-167

TOPIC TAGS: bactericide, bacteria, plant growth

ABSTRACT: The effect of *Hyssopus officinalis* L. ethereal oil on bacteria of the enteric-dysenteric group was investigated in order to fill a gap in the literature concerning the effect of *Hyssopus* ethereal oil on microorganisms. The bactericidal dynamics of ethereal oil in various phases of growth was also studied. Since *Hyssopus* racemes contain 90% of the ethereal oil, the investigation was confined to the racemes. The oil was extracted from the racemes at various stages of growth, using the Ginsberg micromethod. The antimicrobial action of the ethereal oil was tested on cultures of Shigella flexneri, Sh. newcastli, and Sh. sonnei. The culture medium was made up of yeast agar (20% yeast autolysate, 0.5% sodium chloride, 2.8% agar-agar). It was found that the raceme exhibits maximum bactericidal properties in the building stage and the early part of the blossoming stage and that antimicrobial action is most pronounced in the upper part of the raceme. International Conference on the Peaceful Uses of Atomic Energy. 2d, Geneva, 1953

Dobly sovetskikh nauchnykh radioaktivnykh i radioizotopnykh problem (Reports of Soviet Scientists Radioactivity and Radiation Medicine Moscow, Izdat. Glav. upr. po radioaktivnym i radioizotopnym problemam pri Sovete Ministrów SSSR, 1959, 469 p., 6,000 copies printed. (Series: Trudy, tom 5))

General Ed.: A.M. Lebedintsev, Corresponding Member, USSR Academy of Medical Sciences; Ed.: Z.S. Shirokova; Tech. Ed.: Ye.I. Matzli.

PURPOSE: This book is intended for physicians, scientists, and engineers as well as for professors and students at universities where radiobiology and radiation medicine are taught.

CONTENTS: This is Volume 5 of a 6-volume set of reports delivered by Soviet scientists at the Second International Conference on the Peaceful Uses of Atomic Energy, held on September 1-15, 1953 in Geneva. Volume 5 contains 32 reports, edited by scientists of Medical Sciences S.V. Lur'evskiy and V.Y. Sedov. The reports cover problems of the biological effects of ionizing radiation, future consequences of radiation in small doses, genetic effects in medical and biological research, uses of radioactive isotopes for diagnostic and therapeutic purposes, soil absorption or uranium fission products, their intake by plants, and their storage in plants and products. References accompany each report.

AUTHORS: Kashtanov, L. I. (Deceased), Sokolova, L. N.

TITLE: On the Question of the Limiting Concentration of the Inhibitor
in the Oxidation of Sodium Sulfite by Atmospheric Oxygen

PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 9, pp 1914-1917
(USSR)

ABSTRACT: It was established in a previous paper (Ref 1) that the phenol
as an inhibitor (I) used for the sulfite oxidation, shows a
limiting concentration (LC) of approximately 1%. It was in-
vestigated in the present case whether pyridine (Py), which
is also used as oxidation-(I), possesses a (LC). The same ap-
paratus and investigation method were applied as in the paper
by L. I. Kashtanov and V. P. Ryzhov (Ref 2), using the follow-
ing (I)-concentrations: 0.1, 1, 5, 10% (Py), 0.1, 1, 5, 15%
pyridine chloride (PyCl), 0.1, 0.3, 0.6% phenol (Ph), for
ethanol (II)-concentrations of 0.1, 1, 3, 6.7%. The con-
centration of the sodium sulfite (III) was 0.63% for all cases,
and the investigation temperature 18°C. The experimental results
(Figs 1,2) indicate that the (LC) of (Py) is obtained at 5%
(Py); above that the degree of inhibition of the oxidation
remains constant. At concentrations of 0.1-1% (PyCl) inhibits

Card 1/2

SOV/76-33-9-3/37

- On the Question of the Limiting Concentration of the Inhibitor in the Oxidation of Sodium Sulfite by Atmospheric Oxygen

stronger than (Py), and for concentrations of up to 15% (PyCl), no (LC) of the inhibition through (PyCl) could be observed either. Further experimental results (Table) indicate, that already at a combined concentration of (I) + (II) of 0.1%, the oxidation-reaction of (III) is entirely inhibited, i.e. that (I) causes a considerable reduction of the (LC) of (II), since this is 7% for (II) alone. Experiments with aspirin (IV) as an (I) indicated that it inhibits at the start the (III)-oxidation, and then acts catalytically. A combined action of (IV) and (II) eliminates the catalytic reaction of (IV) on the (III)-oxidation, and inhibits the latter already at concentrations of 0.1% of (IV) and (II) respectively. There are 2 figures, 1 table, and 2 Soviet references.

TITLE: Effect of the chemical nature of the fluxes on the
luminescence properties of zinc sulfide and zinc-cadmium
sulfide phosphors

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya,
v. 25, no. 3, 1961, b08-b10

TEXT: This paper was presented at the 9th conference on luminescence
(crystal phosphors) Kiev, June 20 to 25, 1960. The authors attempted to
check the hypothesis made by F. A. Kroger (Ref. 2: Kroger F. A.,
Helligman J., Smit N., Physica, 15, 990 (1950)) in which he states that in
the synthesis of sulfide luminophors a chlorine ion and the ions of tri-
valent metals act as coactivators. The authors quantitatively determined
the Na⁺ ion (by means of uranyl acetate), Li⁺ ion (in form of a sulfate
after separation of zinc with barium carbonate) and of the Cl⁻ ion
(nephelometrically in form of AgCl) in the luminophors ZnS-Zn; ZnS-5·10⁻⁴Cu

Card 1/2

Effect of the chemical nature...

and $ZnS \cdot 5 \cdot 10^{-5} Cu$. The luminophors had been tempered on air with 5 % NaCl at 950°C. The results of the analyses shown in Table 1 indicate that in the luminophors not only one chlorine ion but also an equivalent amount of a monovalent cation of the flux are fixed. This proves that the chlorine ion does not act as coactivator with respect to the activator introduced. Studies of the luminescence spectrum of the luminophor $ZnS \cdot g, Al$ which had been produced in exact accordance with the data by Kröger did not confirm the assumptions made by Kröger: the zinc band is depressed in the presence of Al on calcining in H_2S at exactly the same concentration of $g+$

($1 \cdot 10^{-4}$ g/g ZnS) as on calcining with NaCl on air without addition of Al. The authors were able to prove only one effect which Kröger had described in his paper: in the presence of aluminum the zinc band does not suffer extinction when the luminophor had been calcined in H_2S . The mechanism of the effect of the Al flux suggested by Kröger has been studied in detail. The authors arrived at the conclusion that in ZnS luminophors Al^{+++} cannot function as coactivator since Al_2S_3 is not formed and Al_2O_3 is not soluble in Zns. The authors also point to the strong effect of aluminum oxide on

Effect of the chemical nature...

the crystallization of the fundamental substance: the grain size in the presence of Al_2O_3 is considerably smaller. In the following discussion A. M. Gurvich deals with the effect of the Cl^- ions on the formation of the luminescence centers and the effect of Al^{+++} and Ga^{+++} ions as coactivators. E. Ya. Aranova is mentioned. There are 2 tables and 3 non-Soviet-bloc references.

TITLE: Investigation of the recrystallization process of the 3M661
(EI661) alloy

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Chernaya metallurgiya,
no. 1, 1961, 176 - 180

TEXT: The investigation purpose was to find the recrystallization threshold of 3M661 (EI661) steel. [Abstracter's note: The chemical composition is not given]. 1) Imprints by a 10 mm diameter ball under 3,000 kg load; heating to different temperature, soaking for 40 min, then cooling in open air; 2) Imprints with the same ball under 6,000 kg pressure; heating to different temperatures, soaking for 40 min, cooling; 3) Rolling at different temperatures with 80% reduction. The recrystallization diagram (Fig. 5) was plotted using forged half-cylinders 30 mm in diameter and 25 mm high, with a coordinate network traced on the parting surface of one

Card 1/5

S/148/6:/000/001/014/015

Investigation of the recrystallization process... A:61/A:33

of the half-cylinders. The pairs of specimens (i.e. the split cylinders) were placed into ring sheaths from 1X18H9T (1Kh18N9T) steel with 7.5 mm wall and heated in electric two-chamber furnaces in two stages: preliminary heating to 800°C in 30 min, then to the finally required forging temperature in 15 min. The heated specimens were upset in a crank press at 1.5 - 1.0 m/sec, and cooled in air. The total deformation was 20, 40 and 60%. The deformation of one of the specimens is illustrated (Fig. 4). The etching fluid consisted of 100 g CuSO₄; 500 cm³ HCl; 25 cm³ H₂SO₄; 400 cm³ H₂O. The specimens deformed at 1,050 - 1,200°C were difficult to etch and covered with a light brown film. It was stated that austenite in these specimens was highly workhardened. Relaxed for 48 - 60 hours they etched for 60 sec without any film. The quantity of flat grains was determined using Saltykov's method (Ref. 1: Introduction to stereometric metallography, published by AN Arm. SSR, 1950), and the quantity of nucleate points in 5 to 10 fields. Prior to deformation the mean austenite grain size was 652 μ^2 , and no great difference in grain size was observed. The grain size increased on account of collective crystallization at higher temperatures and higher deformations, particularly at the critical degree of deformation. The

Card 2/3

S/148/61/ccc/001/014/015

Investigation of the recrystallization process... A161/A133

exception was at $1,180^{\circ}\text{C}$ when the size reduced instead of increasing, not only at the critical deformation but at high deformation degrees, too. At $1,150^{\circ}\text{C}$ the grain size was $600 \mu^2$, and at $1,180^{\circ} - 500 \mu^2$; the maximum size was 5,650 and $2,250 \mu^2$ respectively. At $1,250^{\circ}\text{C}$ the grain size at the critical deformation was $5850 \mu^2$, and at high deformation degrees $1200 \mu^2$. At reductions of over 12% the grain size did not depend on the deformation degree at any temperature. No second maximum of grain size could be stated in diagrams despite upsetting to nearly 90% at high temperature. Conclusions: 1) The plotted recrystallization diagrams cover a wide range of deformations that occur in practice in specimen tests. 2) The EI661 steel grain grows with the raising temperature. The exception is at $1,180^{\circ}\text{C}$ where the grain size decreases at critical and higher deformation degrees. 3) A reduced grain size at $1,180^{\circ}\text{C}$, is accompanied with an increased plasticity of the EI661 steel in pressure working. 4) The grain size does not depend on the degree of deformation at compression above 12%. 5) The temperature of the recrystallization threshold depends on the deformation degree: it is about $1,000^{\circ}\text{C}$, at low deformation degrees near the critical; at higher deformation degrees it is lower. 6) No second maximum forms on the recrystallization diagram. This is due to the peculiar deformation conditions at up-

TITLE: Some Problems Concerning Practical Training in Physics

PERIODICAL: Fizika v shkole, 1959, Nr 3, pp 66-68 (USSR)

ABSTRACT: The author recommends some problems suitable for practical physics training in the ninth class. Having stressed the importance of practical training in physics (measuring of magnitudes), which must be a complement to "frontal" teaching (study of physical phenomena and laws), the author criticizes the shortcomings of the program of practical training in physics, particularly for the ninth class. In order to overcome this deficiency, he proposes several problems (illustrated by diagrams) as follow: 1) determination of the magnitude of centripetal forces with the aid of a centrifuge; 2) study of the de-

TITLE: Spectral Examinations With "Ultra" Research Installation. I. Study of the Character of the Spectrum and of the Ion Temperature

PERIODICAL: Zhurnal tehnicheskoy fiziki, 1960, Vol. 10, No. 12.
pp. 1422 - 1432

TEXT: The spectrum of the discharge was investigated within the range of 350-5000 Å. The spectrum of 350-4000 Å was recorded by a vacuum spectrograph (600 lines/mm), the optical axis of the instrument was laid in a radial direction. From 4000 Å to 5000 Å a quartz spectrophotograph was used. Fig. 1 shows several spectra recorded by the apparatus. For determining the ion temperature, the authors used the relation

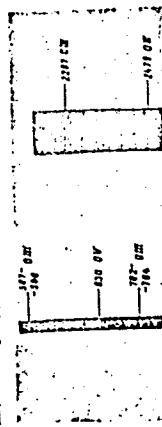

$$\tau = 1.95 \cdot 10^{12} n(d\lambda/\lambda)^2 \quad (1)$$

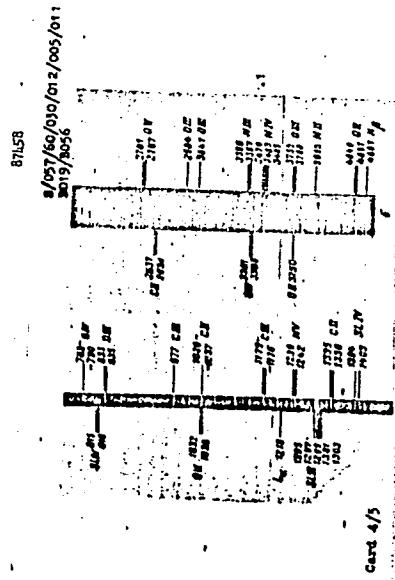

on the supposition that a Maxwell velocity distribution function and a pure Doppler broadening of the spectral lines exists. From the data concerning the temperature of the ionization zone obtained herewith it follows that, in dependence on the selection of the lines, from those broadening the ion temperature is determined with (1), the calculated temperature varies about the range of 0.5-1.0 - 15-16° C. The calculated temperature value is the higher, the stronger the emission of the ion according to which line broadening the temperature has been determined. This indicates an independent motion of the ions of different charges and a discontinuity of determining the plasma temperature. Thank B.-V. Kondratenko for discussions and B. I. Kalyanov for assistance. The authors are grateful to D. P. Chayke for taking part in the work. There are 6 figures, 4 tables, and 7 references; 3 Soviet and 4 US.

TITLE: Spectral Examinations With "Al'fa" Research Installation.

PUBLICATION: Journal Tekhnicheskoy Fiziki. 1960, Vol. 30, No. 12,

p. 1435 - 1436

TEXT: Directed ion movements in "Al'fa" were measured by determining the spectral line shift of ions caused by the Doppler effect. The experiments were carried out with a low-dispersion quartz spectrograph and a spectroradiograph of the type M-10 (DPR-10), having a dispersion of 0.6 nm/mm. The pictures were taken in tangential direction and, apart from the spectrum, is shown in Fig. 1. The ion velocities calculated from the line shift and the rotation-square error are given in Table 1. As may be seen, the velocity of directed ion movement does not exceed 10^5 cm/sec, and increases with increasing ion charge. There are

TITLE: The use of an electron optical amplifier with a Fabry Perot Standard and a monochromator for time sweeps of the spectrum

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 4, 1962, 768-770

TEXT: These instruments make it possible to obtain a time resolution up to $3 \cdot 10^{-12}$ sec and to work with a powerful lens system. The entire height of the slit is focused on the photocathode of the amplifier. The aperture of the monochromator slit must be $\beta = \psi_i \frac{d_e}{d_p}$ where $\psi_i = \psi_p/n = 2\sqrt{\frac{\lambda p}{tn}}$ is the aperture height of the p-th ring, d_e and d_p are the diameters of the interferometer and the grating. The maximum value of p is given by $p_m = \frac{1}{2} (\frac{1}{\chi})$ where $\frac{1}{\chi}$ is equal to the number of the resolved intervals on the photocathode. The ratio between the energy recorded with an electron optical amplifier, and the energy recorded by a photoelectronic

The use of an electron optical...

multiplier is $E_{com}/E_{phm} = \psi_{p_m}/n/\psi_1/n = \sqrt{\frac{1}{2\kappa}}$. The maximum efficiency is attained if the following holds for the slit height: $\beta d_p \geq d_e \sqrt{\frac{2\lambda}{tn}} \left(\frac{1}{\xi_1}\right)$. The optimum width is calculated from $a_m \leq h/\sqrt{p_m}$. There are 1 figure and 1 table.

TITLE: Use of the Fabri-Pérot calibration instrument with a monochromator and an electron-optical amplifier for the time-base sweep of a spectrum

PERIODICAL: Zhurnal tekhnicheskoy fiziki, v. 33, no. 2, 1963, 191-199

TEXT: A method of using a Fabri-Pérot interferometer in recording the contours of spectral lines by means of an electron-optical amplifier is described. The arrangement is similar to that usually employed with a monochromator for preliminary dispersion (DAN SSSR, 145, 4, 768, 1962), but no diaphragm is used behind the outlet slit of the monochromator. Hence the illuminating power of this arrangement is by about one order of magnitude greater than that of the usual combinations of interferometer and monochromator plus photomultiplier. This is proven by corresponding calculation. Testing results are given. There are 6 figures and 2 tables.

Title : Synthesis of 1,1-pentamethyleneglycerin

Periodical : Zhur. ob. khim. 24/10, 1874-1884, Oct 1954

Abstract : Two methods employed in the synthesis of 1,1-pentamethyleneglycerin from cyclohexanone are described. Quoting the conversion of ethyl ether of beta,beta-pentamethylene glycidic acid into 3,3-pentamethyleneglycide, as an example, it is shown that glycidic ethers can be reduced with lithium alumohydride into homologous alcohols with perfect preservation of the alpha-oxide ring. Ten references: 8-USSR; 1-USA and 1-French (1891-1952).

Oxidation of 2-acetylhexahydroacetophenone. A. Ya.

Berlin and L. V. Sokolova (S. Ordzhonikidze All-Union

Sci. Research Chem. Inst., Moscow). *Zhur.*

Obozr. Khim., 25, 334-7 (1955); *J. Gen. Chem. U.S.S.R.*

25, 335-7 (1955) (Engl. translation); cf. following abstr.—
 $C_6H_{11}COCH_3O\cdot$ I (I), b.p. 102–15° m. 42–3° (1.54 g.) in 10
ml. EtOH treated with 45 ml. H₂O₂, then with 3.42 g.
AgNO₃ in 14 ml. H₂O, and, slowly, with 1.9 g. NaOH in
17 ml. H₂O; the mixt. filtered after 10 min. on a steam bath,
and the aq. soln. extd. with Et₂O, acidified, and again extd.
with Et₂O yielded a mixt. of acids sepd. by extn. with cold
C₆H₆, giving 0.17 g. insol. acid, m. 134.5–5°, identified as
hexahydromandelic acid (II) (a pure specimen was prep'd.
also from C₆H₁₁CHO, NaHSO₃, and NaCN, the inter-
mediate nitrile being hydrolyzed with concd. HCl to the
amide, m. 100–7°; which with 10% KOH gave the free acid).
The C₆H₆-sol. acid (0.8 g.) could not be directly crystd.
and was treated with SOCl₂ and NH₃, yielding an amide,
m. 186–7°, identified as hexahydrobenzamide. II is un-
attacked by Ag₂O under the above conditions. The ox-
idation of I probably yields C₆H₁₁COCH₂OH, which ox-
idizes to C₆H₁₁COCHO, and this in turn yields II and C₆H₁₁-
COCO₂H, the latter finally yielding C₆H₁₁CO₂H.

TITLE: Steroids (Steroidy). II. Synthesis of Progesterone From
Solasodine (II. Sintez progesterona iz solasodina)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 1, pp 329-332 (USSR)

ABSTRACT: The present paper gives experimental data concerning the transformation of solasodine into the hormone progesterone. Solasodine (I) is, as we know, an aglucone of the steroid glucoalkaloids separated from *Solanum aviculare* Forst. This plant was cultivated in the USSR. A. S. Labenskiy synthesized solasodine. The synthesis of progesterone from solasodine has hitherto not been described. In reference 2 it was only noted that in the case of heating solasodine (I) with acetic acid anhydride in connection with further oxidation and saponification of the reaction products a semi-crystalline product results which was chromatographed, acetylated and separated after further treatment as the acetate of $\Delta^{5,16}$ -pregnadienol- 3β -on-20 (IV) and 3β -acetoxy-16-methoxy-20-keto- Δ^5 -pregnene beside
