Title : Fitting and assembling internal polishing spindles on anti-friction bearings.
Periodical : Stan. 1 instr., 4, 28-32, Ap 1956
Abstract : The authors describe the analytical work carried out to establish the most efficient method of putting together the internal polishing spindles in anti-friction bearings. These bearings were installed in the automatic lines at the First State Bearing Works (1 GPZ), the Moscow Plant for Polishing Machines (MSZ) and Bureau-6 for Design of Machine Tools (SKB-6). Eleven formulae, 11 drawings and GOST standard.

Oxidation of paraffin distillate. A. F. Ivankin and G. A. Solov'ykh (Institute Chem. Tech. Inst., Leningrad). *Zh. Priklad. Khim.* (J. Applied Chem.) 23, 1326-30 (1950). Petroleum paraffin fraction (500 g.) was oxidized in glass app. by air blowing at 20 l. min. at 100-110° in presence of various naphthene acid salts as catalysts. Mn salt is the best. The initial material contained 21% aromatic hydrocarbons (I), 41% naphthene hydrocarbons, and 34% aliphatics. Raw paraffin cut oxidizes very poorly and yields much tar, so that in 8-10 hrs. the product has the acid no. of barely 3 mg. KOH per g. If I are removed the residual oxidizes more readily and goes at the rate of 10 acid no. units per hr. The removal of I is done with H₂SO₄ treatment 30 min. at 50°, and the product contains 1.6% residual I which are not very deleterious to the oxidation step. The retardation of oxidation by I is caused largely by accumulation of aromatic acids. For better yields of acids it is best to carry the oxidation stepwise with intermittent leaching of the acids by means of alk. washes. Likewise, gradual addn. of the catalyst is helpful. G. M. Kosolapoff

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 8, No 5, Sep-Oct 63, pp 445-449.

Abstract [Authors' English summary modified]: Between 1950 and 1962, 84 cases of anthrax were treated at the Cluj Clinic for Contagious Diseases, of which 12 were children. None of the cases was lethal; all presented cutaneous localization, 8 with malignant edema and 76 with malignant pustulae. Sources of infection were animals or their products in 39 cases, insect bites in 10, other causes in 3 and unidentified in 32 cases. It is pointed out that the morbidity rate has been falling to no cases at all in Cluj during 1962, and that mortality has been brought down to zero from 6% since sulfonamides and especially antibiotics have been associated with serum therapy. Includes 1 table and 7 references, of which 1 Russian and 6 Rumanian.

TITLE: Determination of the coefficient of heat transfer to boiling liquids with a continuously changing heat flux

PERIODICAL: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no.4, 1962, 111-114

TEXT: The difficulties in obtaining heat transfer coefficients for boiling liquids, particularly the problem of measuring the temperature of the heating surface are explained. A method to overcome these difficulties is proposed. It is assumed that the heat transfer follows the law $\alpha = Cq^n$ and the effective temperature difference is given by $t_w - t_f = q/\alpha = \frac{1}{C} q^{1-n}$. Since the thermocouple

is situated a certain distance under the surface the relation $\Delta t_{w1} = K_1 q^m - K_2 q = \varphi(q)$ is obtained, where Δt_{w1} is the temperature difference between the fluid and the thermocouple junction. The

Process and properties

An apparatus for determining the content of carbonates in soils and minerals. A. N. Sukovkin. *Izv. Akad. Nauk S. S. R. 1960, No. 12, 70-83; Khim. Refert. Zhor. 1960, No. 2, 65.*—The app. measures the vol. of gas evolved on decompos. of the carbonate minerals with acid, either in the cold or with heating. A vertical cylinder is connected by rubber tubing with a buret according to the principle of equalizing vols. The lower part of the cylinder, the rubber tubing and the buret are filled with colored kerosene. The cylinder is stoppered and a thermometer and a funnel with a stopcock are passed through the stopper. A heater surrounded by electrically heating coils is fastened on a rubber ring inside the cylinder below the stopcock of the measuring buret. The ends of the heating coil are passed through the cylinder and connected through a rheostat to an a.c. circuit. The sample is placed in the beaker and the cylinder is displaced (with the stopcock open) until the level of kerosene in the buret reaches the zero level. After the kerosene level has reached the zero point the stopcock is closed, the cylinder raised slightly, the temp. read, the coil connected to the a.c. current (if heating is required) and a measured amt. of acid is added from the funnel. After decompos. is complete, the current is disconnected and the app. allowed to cool to the original temp. The level of the cylinder is then displaced until the levels of kerosene in the cylinder and buret are equalized and the buret measurement is taken. The vol. of the gas evolved is the difference between the buret measurement and the vol. of the added acid. The results of the detns. agree well with the results of chem. analyses. W. R. Hena

> Reactions in solution between zirconium nitrate and iodates of the alkali metals. I. M. I. Konarev and A. S. Solovkin. *Zhur. Obshchei Khim.* 24: 1113-18(1954).
in an aq. soln. contg. HNO_3 (Zr concn. 0.095; 1./l.) alkali iodates ppt. hydrated Zr hydroxyiodates with 1 to 3 iodate groups on one Zr atom. (The tetraiodate formed thus was unstable.) The freshly formed ppt. was washed with 3N HNO_3 , with alc., and with ether, and air-dried. Compn. of ppt. depends upon concns. of HNO_3 and KIO_3 in the soln. With low acidity, variation in KIO_3 concn. has little effect: thus at pH 2-3, $\text{Zr}(\text{OH})_2(\text{IO}_3)_2 \cdot 4\text{H}_2\text{O}$ was pptd. from solns. contg. 0.0097-0.161 moles/l. of KIO_3 ; in higher HNO_3 concns. (as 5N) by varying the KIO_3 concn., ppts. with 1 to 3 iodate groups were obtained. Analysis of the isolated triiodate gives the formula $\text{Zr}(\text{OH})_2(\text{IO}_3)_3 \cdot 4\text{H}_2\text{O}$; the diiodate could not be isolated, although present in ppts.

ON THE REACTIONS IN SOLUTION BETWEEN ZIRCONIUM
NITRATE AND THE ALKALI METAL IODATES. II. ON
THE COMPOSITION OF THE PRECIPITATE OF ZIR-
CONIUM IODATE SETTLING FROM THE SOLUTION
CONTAINING POTASSIUM IODATE. M. I. Konarev and A.

S. Solovkin. Zhur. Obshchei Khim. 24(84), 1279-83(1954)
Ang. (in Russian).

The composition of freshly precipitated $Zr(IO_3)_4$ was not established. After prolonged standing in the mother solution the precipitate reacts with KIO_3 and iodic acid to form the hexaiodate and nonaiodate, and it is converted from the amorphous to the crystalline form. The nonaiodate is formed at high concentration of iodate ions. A mixture of the two iodates is more often found, however than the single species of either. (J.S.R.)

SOLOVNIK, A.S.

1957

Reactions in solution between zirconium nitrate and iodates of the alkali metals. III. The effect of the alkali metals on the composition of the zirconium iodate, and the precipitation reaction. M. I. Konarev and A. S. Solovkin. Zhur. Obshch. Khim. 24, 1901-10 (1951).

Zr exists as $Zr(OH)_4$; thus, when a sol. iodate is added, $Zr(OH)_4 \cdot 4H_2O$ is formed. At pH 0.07 or in higher HNO₃ concns. $Zr(OH)_4$, $Zr(OH)_3$, and $ZrOH^{2+}$ are found. Fractional pptn. with small concns. of iodate gives $Zr(OH)_4 \cdot 4H_2O$, $Zr(OH)_3 \cdot 3H_2O$, and $ZrOH^{2+} \cdot 4H_2O$. Of these only the mono- and diiodate were isolated; in solns. with high IO₃⁻ concns. these are converted to the triiodate. After prolonged standing in a mother liquor contg. HIO₃, the triiodate is converted to the tetraiodate. In the presence of an alkali metal iodate the triiodate is converted to the hexa- and heptaiodate; in HCl and solns. the product is mainly $Zr(OH)_4 \cdot 4H_2O$. The stability of such compds. depends upon the pH. The stability of such compds. depends upon the precipitant used. In the order LiIO₃, NaIO₃, KIO₃, RbIO₃. In HNO₃ solns. the zirconyl ion is not found.

Title : On the Influence of the Nature of the Acid on the
Composition of Freshly-Precipitated Zirconium Iodates

Orig Pub : Zh. reorgan. khimii, 1956, 1, No 3, 392-399

Abstract : A continuation (see RZhKhim, 1955, 5483, 23536, 26023)
of the investigation of Zr iodates. From nitric-, hy-
drochloric-, and perchloric acid solutions Zr was preci-
pitated as $Zr(OH)_3(10_3)$ (I), $Zr(OH)_2(10_3)_2$ and

$Zr(OH)(10_3)_3$ (II). Fractional precipitation of indivi-
dual hydroxy-iodates is possible. The authors attribute
the formation of precipitates of varying composition
(from I to II) to the presence, in the solutions, of the
ions $Zr(OH)_3^+$, $Zr(OH)_2^+$ and $Zr(OH)^+$, with which 10_3^-

Card 1/2

TITLE: Determination of the Hydrolysis Constants and the Complex-Formation Constants of Zr^{4+} with Nitrate and Chlorine Ions by the Extraction Method. (Opredeleniye Konstant Gidroliza i Konstant Kompleksobrazovaniya Zr^{4+} s Nitrat- i Klor-ionami Metodami Ekstraksii.)

PERIODICAL: Zhurnal Neorganicheskoy Khimii, 1957, Vol.II, Nr.3, pp. 611-622. (USSR)

ABSTRACT: In this investigation extraction with tributylphosphate from nitric acid solutions with an ionic strength of four was used for studying complex-formation of zirconium with the nitrate ion. The metal was extracted in the form of the complex $Zr(NO_3)_4 \cdot$ tributylphosphate. For the reaction constants of complex-formation between zirconium nitrate and chloride and tributylphosphate were found to be (0.65 ± 0.1) and $(2 \pm 0.2) \cdot 10^4$, respectively, the value for reaction constant for complex-formation with tenoyl-trifluoroacetene being $(1.2 \pm 0.2) \cdot 10^9$. Complex-formation constants for $Zr(NO_3)_3^+$, $Zr(NO_3)_2^{2+}$, $Zr(NO_3)^+$ and $Zr(NO_3)_4$ were found to be equal to 2.2 ± 0.05 , 1.3 ± 0.05

TITLE:

Extraction of Perchloric Acid With Tributyl Phosphate (TBPh)
(Ekstraktsiya khlornoy kisloty tributilfosfatom)

PERIODICAL:

Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 1, pp.222-224
(USSR)

ABSTRACT:

The second author proved (reference 1) that with zirconium-
-extraction from perchloric acid containing solutions HClO_4
passes over in analyzable quantities. Their complex-formation
with TBPh was worth investigating in view of their application
for the maintenance of a constant ionic density. Perchloric
acid was extracted from water by TBPh solution in benzene or
petroleum. The phases were equal with all tests (23 ml). The
equilibrium was attained within 10 to 15 minutes. In tests on
the distribution of perchloric acid between water and 3,67
mol TBPh it was found that with increasing concentration of
 HClO_4 in the initial solution the quantity passing over into
TBPh⁴ increases also (table 1). With the mixture of the phases

Card 1/3

78-1-40/43

Extraction of Perchloric Acid With Tributyl Phosphate (TBPh)

an exothermic reaction takes place which is most intensely in the case of stronger acid solutions (table 1, test 6). It was tried to compute the equilibrium constant of the reaction of complex-formation of HClO_4 with TBPh (K_1), from the obtained results. It is shown in table 1 that K_1 is variable within vast limits. This is apparently achieved by the ionic density of the solution which fluctuates under the influence of the changes of concentration of the acid. With a constant ionic density K_1 remains sufficiently constant ($6,7 \pm 0,5$) $\cdot 10^{-2}$. In this case the equilibrium constant of the reaction of complex formation of HNO_3 with TBPh (K_2) amounts to $0,16 \pm 0,01$ (table 2). The K_2 -value is neither changed by using solutions which are diluted by benzene or petroleum, if the ionic density of the solution is preserved (~ 3) (table 3, 4). The value of K_2 increases with diluting the TBPh-solutions up to $0,22 \pm 0,02$ (little different from references 3 to 6). It is noticeable that the TBPh-dilution with petroleum lead to the formation of a third phase after the extraction if the HNO_3 -content in the initial solution was small, compared with that of HClO_4 (table 4, test 1). The light organic phase ($d_{25}^{20} = 0,750$) is formed of almost pure petroleum with only a small admixture

Card 2/3

78-140/43

Extraction of Perchloric Acid With Tributyl Phosphate (TBPh)

of TBPh and contains no HClO_4 . The heavy organic phase ($d^{25^\circ} = 1,001$) is a solution of HClO_4 .TBPh in TBPh. The third phase appears also with the mixtures⁴ of 0,49 n HClO_4 with 0,25 mol TBPh in petroleum. The heavy organic phase dissolves in petroleum after HClO_4 was re-extracted in water. It is not formed with the TBPh-dilution with benzene. There are 4 tables, and 7 references, 4 of which are Slavic.

TITLE: Extraction of Perchloric Acid and Uranyl Perchlorate With Tributyl Phosphate (Ekstraktsiya khlornoy kisloty i perkhlorata uranila tributilfosfatom)

PERIODICAL: Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 1, pp.225-230 (USSR)

ABSTRACT:

It is generally maintained in literature that the perchlorate-ion has no inclination to form complexes with the elements of the actinide series (reference 1). Perchloric acid and its soluble salts are therefore often used for the maintenance of the ionic density when the investigation of the nature of the compounds existing in aqueous solutions is required (e.g. extraction in tributyl phosphate). The transition of HClO_4 into the organic phase is usually neglected. The authors proved however (reference 4) that the value of the equilibrium-constant of the reaction of HClO_4 with TBPh (K_1) can be compared with that of HNO_3 with TBPh.⁴ The investigation of

Card 1/4

78-1-41/43

Extraction of Perchloric Acid and Uranyl Perchlorate With Tributyl Phosphate

the distribution of HClO_4 between its aqueous solution and the TBPh is continued in the present paper. Experimental part. The methods for HClO_4 were previously described (reference 4). The tests were carried out with a constant ionic strength of the aqueous phase (0,1 to 3). The solutions were produced in such a way that - after the extraction of the uranyl perchlorate - the HClO_4 -content in the aqueous phase is approximately constant and equal to the prescribed ionic density. The TBPh-concentration being in equilibrium in the organic phase (TBPh) was determined by taking account of the changes of the phase-volumina. Since a number of conditions of the uranium-extraction from perchloric acid solutions which were not described previously, was clarified meanwhile, the original aim of the paper was modified and the tests were continued for clarifying the following questions: 1) The influence of μ on $K_{\text{PuO}_2(\text{ClO}_4)_2}$ between water and TBPh. 2) Influence of the concentration of the same compound on TBPh with constant ionic density of the aqueous phase. 3) Influence of the salting out on $K_{\text{PuO}_2(\text{ClO}_4)_2}$ (LiClO_4 and NaClO_4). 4) Influence of the diluters which are added to TBPh on

Card 2/4

78-1-41/43

Extraction of Perchloric Acid and Uranyl Perchlorate With Tributyl Phosphate

$K_{PUO_2(ClO_4)}$. The test results are given in tables 1 to 3.

They show above all that U(VI) is extracted to a considerable extent from perchloric acid solutions by TBPh though the values of the coefficients of distribution here, with equal other test conditions were much smaller than with an extraction from nitric acid solutions. Nevertheless uranium passes completely over into the organic phase (table 2) at high TBPh-concentrations in the organic phase, or when a salting out-salt is present in the aqueous phase (e.g. $NaClO_4$) after a single shaking. It became evident by further tests that the graphical method of the determination of the composition of the complex compound extracted by TBPh cannot be applied in the case of perchloric acid solutions. Hence, it does not follow that the mechanism of extraction of $HClO_4$ and of $UO_2(ClO_4)_2$ differs substantially from that of the nitric acid solutions by TBPh. It can apparently be expected that $HClO_4$ and uranyl perchlorate pass over into the organic phase which contains TBPh, as solvents $HClO_4$ -yTBPh and $UO_2(ClO_4)_2$ -xTBPh. TITLE: About the Extraction of the Uranyl Perchlorate by Means of Tributyl Phosphate (K ekstraktsii perkhlorata uranila tributilfosfatom)

PERIODICAL: Zhurnal neorganicheskoy khimii, 1958, Vol. 3, Nr. 8, pp. 1965-1967 (USSR)

ABSTRACT: The distribution of uranyl perchlorate between water and a solution of 1,2 mol. of tributyl phosphate (TBP) in CCl_4 was studied as a function of the concentration of the salt in aqueous solution (Table 1). It was shown that $K_{PuO_2(ClO_4)_2}$ increases with a rise of the uranyl concentration in the solution. When uranyl perchlorate is extracted by means of tributyl phosphate an increase of the water contents occurs in the organic phase. In virtue of the experiments it is assumed that uranyl perchlorate is extracted by tributyl phosphate in the form of the following compound: $UO_2(ClO_4)_2 \cdot 2H_2O \cdot 2TBP$.

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1958, Vol 3, Nr 9, pp 2:09-2112
(USSR)

ABSTRACT:

The distribution of nitric acid between the aqueous and the organic phase containing tributyl phosphate in dependence on the aqueous phase and the nature of the solvent of tributyl phosphate was investigated. From the results may be concluded that K_p considerably depends on the nature of the solvents of tributyl phosphate. The influence of the nature of the solvents on the distribution of nitric acid between water and tributyl phosphate was investigated in the case of an ionic strength of the solution of 1, 0,5 and 3. The maximum value of K_p in nitric acid solution with the ionic strength of 3 is obtained if toluene is used as solvent for tributyl phosphate. The change of K_p by the nature of the solvent in the case of an

TITLE: On the Influence of the Nitrates of Barium, Nickel, Cobalt, and Copper on the Extraction of Nitric Acid in Tributyl Phosphate (TBP) (O vliyanii nitratov bariya, nikelya, kobal'ta i medi na ekstraktsiyu azotnoy kisloty v tributilfosfat (TBP))

PERIODICAL: Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 6, pp 1454 - 1456 (USSR)

ABSTRACT: The distribution of nitric acid between the aqueous and inorganic phase of the solution of TBP in kerosene was investigated in the presence of barium-, nickel-, cobalt-, and copper nitrates in the case of an ionic strength of the aqueous phase of 1 and 1.5. The results are summarized in a table and given in figures 1 and 2. The nitric acid extraction in the organic phase increases with the rise of the ionic strength in the solution. A low distribution coefficient of the nitric acid is obtained by the use of barium nitrate as salting-out compound. The same effect is obtained by cobalt-, nickel-, and copper nitrates as salting-out compounds in the case of the nitric

TITLE:

Zirconium Iodates Precipitated From Solutions and Containing Less Than One Chlorine Atom to One Zirconium Atom

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1959, Vol 4, Nr 11, pp 2642-2644 (USSR)

ABSTRACT:

Publications do not contain any data on iodates containing less than one iodate ion to one zirconium atom. The data on the composition of zirconium sulphates, -chlorides and -nitrates (Ref 1), however, suggest that the zirconium iodates form such precipitations. The preparation and analysis of zirconium-iodate precipitations are described in references 2, 3. The present paper reports on precipitation of iodates from zirconium-chloride solutions containing 0.92 and 0.35 chlorine atoms to one Zr-atom. Such solutions can be obtained by repeated evaporation of $ZrCl_2$ -solutions while hydrochloric acid volatilizes. These solutions poor in chlorine are stable for months as had also been stated by I. Ya. Bashilov (Ref 8). The Zr-iodates were precipitated by means of KJO_3 from solutions containing 0.105 and 0.21 mols of Zr. In the solutions with a ratio of $Cl^- : Zr = 0.92$ and 0.35,

Card 1/2

the equilibrium was established after three days (Table 1). Table 2 gives an analysis of air-dry precipitations. The ratio of JO_3^- : Zr depended on the concentration of the KJO_3 used for precipitation, on the concentration of Zr, and on the ratio of Cl^- : Zr. The precipitates had no constant composition. Under the conditions described, Zr evidently forms polymeric ions representing an uninterrupted series with the general formula $\text{Zr}_n(\text{OH})_m^{+4n-m}$. The average charge of these ions varies in dependence on the Zr- and Cl-concentration within wide limits but is mostly smaller than 1. In solutions with a ratio of Cl^- : Zr = 0.35, Zr occurs as a hydroxide, in agreement with references 11, 12. There are 2 tables and 12 references, 5 of which are Soviet.

On the Ferrocyanides of Zirconium¹

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1960, Vol 5, Nr 1, pp 73 - 79
(USSR)

ABSTRACT:

The author investigated the reaction of zirconium nitrate and zirconium chloride with potassium ferrocyanide by the solubility method and by the measurement of light adsorption. Experimental data (Table 1, Fig 1) reveal that the beginning of the precipitate formation depends on the hydrogen ion concentration, and precipitate with varying composition separate (Tables 2,3). Pure $Zr[Fe(CN)_6] \cdot 6H_2O$ was obtained from acid solutions only. The light extinction curve of the solutions (Fig 2) does not point to any compound with constant composition. The forming precipitates are initially white, but turn yellow to green under the action of light in consequence of the formation of free iron ions, which are co-precipitated with the zirconium ferrocyanides. These results confirm the already

TITLE: Formation of the Third Phase in the System
UO₂(NO₃)₂ - HNO₃ - H₂O - Tri-n-butyl Phosphate - "Kerosene"

PERIODICAL: Zhurnal neorganicheskoy khimii, 1960, Vol. 5, No. 9,
pp. 2115-2118

TEXT: The formation of a third phase of the system mentioned in the title was investigated. The uranium content was gravimetrically determined, and the tributyl phosphate content in the organic phase (after separation) was colorimetrically measured with a CФ-2А(SF-2) spectrophotometer. All experiments were conducted at room temperature. It was found that the formation of a third phase was independent of the concentration of uranyl nitrate (at sufficiently high acidity) (Table 1). A decrease of acidity below a certain point leads, also in the presence of large amounts of uranyl nitrate, to the vanishing of the third phase (Table 2). Absorption spectra (recorded by L. V. Lipis) showed that uranium appeared in the organic phase as neutral, non-ionized molecules UO₂(NO₃)₂ solvated with

the solution. To explain the extraction mechanism of zirconium nitrate with tributyl phosphate from high-acidity solutions, the authors studied the effect of the hydrogen ion concentration on the extraction coefficient. The extractions were conducted by the method described by A. S. Solovkin (Ref. 3). Carbon tetrachloride was used as solvent for tributyl phosphate. The zirconium concentrations were determined with the aid of the radioactive isotope Zr^{95} . Results are given in Figs. 1 and 2. The authors discussed the possibilities of increasing α_{Zr} by changing the hydrogen ion concentration. It is assumed that the extraction of $Zr(NO_3)_4$ with the organic phase occurs as $Zr(NO_3)_4 \cdot 4(HNO_3) \cdot TBP$ and $Zr(NO_3)_4 \cdot 2(HNO_3) \cdot TBP$. Fig. 2 shows α_{Zr} as a function of concentration. The presence of zirconium acido complexes in the aqueous phase hardly influences the extraction coefficient. There are 2 figures, 2 tables, and 8 references: 6 Soviet and 2 US.

TITLE: The chemistry of aqueous solutions of zirconium salts (Does there exist a zirconyl ion?)

PERIODICAL: Uspekhi khimii, v. 31, no. 11, 1962, 1,394 - 1,416

TEXT: A systematic survey of literature data referring to the chemistry of zirconium in aqueous solutions is given. In a subsequent discussion of the properties of aqueous and acidic solutions of zirconium salts (generally chlorides and nitrates) it is shown that the theory assuming the existence of a zirconyl ion is erroneous. The existence of zirconium trichloride cannot be explained, for instance, by this theory. The inaccuracy of the assumption of zirconyl and dizirconyl ions can be proved by the results given in several publications, by X-ray investigations of crystalline zirconium chloride and bromide samples and their solutions. Processes occurring during aging, or during heating of zirconium-salt solutions are explained by the authors according to the theory of Tomas cited by L. Pokras in J. Chem. Educ., v. 33, nos. 4, 5, 6 (1956). ✓

Card 1/3

The chemistry of aqueous solutions of

S/074/62/031/011/001/001
A057/A126

i.e., by hydrolysis and formation of hydroxyl, and/or oxide bridges (with simultaneous proton evolution) in the first stage of condensation ("olation"), and further dissociation (accompanied by proton evolution) ("oxolation"). In solutions containing 1 - 2M HClO₄, at 25°C and a zirconium concentration of about 10⁻⁴ to 0.02M the olation process occurs stepwise ending with the formation of the trimer [Zr₃(OH)₄]³⁺ and tetramer [Zr₄(OH)₃]⁸⁺. The latter is the prevailing form of zirconium in its aqueous dichloride solutions at a 2M concentration. A transformation to the oxo-forms occurs in the absence of strong complexing agents. In solutions containing strong complexing agents there exists, apparently, only the monomolecular form of zirconium. The process does not end with the formation of the trimer and tetramer in weakly acidic solutions, but occurs continuously until polymers with a high molecular weight are forming. A change of the charge of the complex ions may occur in hydrochloric, nitric acid solutions, or after addition of neutral salts with the same anion. An inversion of the sign of the charge happens often in hydrosols of zirconium oxide, thus resulting in an "identification" of nonexisting zirconium complexes. The specific chemical behavior of zirconium and of processes which occur in solutions and in the solid phase have to be also considered in the preparative chemistry of

Card 2/3

The chemistry of aqueous solutions of

zirconium compounds. Hence, the authenticity of analytical formulas for so many zirconium compounds with unusual composition (especially sulfates) have to be considered cautiously. Several data from articles published after subject paper was concluded, are presented as an addition. These data are in good agreement with the conclusions presented in the present paper.

TITLE: Dynamic demagnetization curves of cores of self-saturating magnetic amplifiers

PERIODICAL: Avtomatika i telemekhanika, v. 24, no. 2, 1963,
248-254

VB

TEXT: The authors show that the dynamic demagnetization curve, as used in the Roberts method of control of magnetic amplifiers, makes it possible to calculate, with an accuracy sufficient for practical purposes, the input-output characteristic of a self-saturating magnetic amplifier and may be thus used for the amplifier design, control and core selection. The principle of the dynamic demagnetization curves has been used at the Moskovskiy energeticheskiy institut (Moscow Institute of Power Engineering) in the design of special equipment for the analysis of tape and toroidal cores of various dimensions and at various frequencies. The results obtained
