TITLE: On the quantitative investigation of efficient emitters in a wide temperature range by observation of contrast in the electron-optical image Report, 11th All-Union Conference on Cathode Electronics held in Kiev, 11-18 Nov 1963

SOURCE: AN SSSR, IZV. Seriya fizicheskaya, v.28, no.8, 1964, 1360-1366

TOPIC TAGS: emitter, electron emission, electron microscopy, electron optics, cathode

ABSTRACT: The present work was a continuation of a series of studies by the authors of emitters and surface emission by means of various electron-optical techniques. The authors' earlier analysis of contrast formation in an electron-optical image of an emitter is generalized to the case of nonuniform efficient cathodes. The results provide the basis for interpretation of data on local emission, taking into account various factors. For the present study there was used an electronic circuit that made possible rapid measurement of local currents from a whole region of the emitter, rather than from a point. The formation of (phase) contrast under the influence

1/3

L 19563-65

ACCESSION NR: AP4044654

2

of different factors (microfields, patch fields, photoemission, secondary emission, etc.) is discussed and the pertinent formulas are adduced. A block diagram of the emission electron microscope used for the study is shown in the Figure (Enclosure). A number of photographs of emitter surfaces are reproduced in the text. By means of the developed oscillographic procedure it should be feasible to perform rapid analyses of various cathodes in different stages of preparation. "The authors are grateful to A.M.Rozenfel'd for assistance in rebuilding the emission microscope." Orig.art.has: 10 formulas and 5 figures.

TITLE: Observation of local contaminant films by means of a mirror electron microscope Report, 11th All-Union Conference on Cathode Electronics held in Kiev, 11-18 Nov 1963

SOURCE: AN SSSR. Izv. Seriya fizicheskaya, v.28, no.8, 1964, 1382-1386

TOPIC TAGS: electron emission, electron microscopy, contamination, vacuum system

ABSTRACT: The present study is one of an extensive series of investigations by the authors' group of emitter surfaces, microfields, p-n junctions and so on, by means of electron microscopes. The aim of the present work was direct visualization of local deposits consisting of contaminant films<sup>1/6</sup> of the type that form in vacuum systems with an electron beam by means of a mirror electron microscope. A common feature of electron mirror images are dark spots, which, it has been found, may represent dust particles or other protrusions on the specimen, local variations of the contact difference of (patch fields), local oxide films, other films of various contaminants (remaining on the surface owing to inadequate cleaning of the specimen) or films

1/2

L 19562-65  
ACCESSION NR: AP4044658

settling on the specimen surface in the vacuum installation (oil, vacuum grease, rubber vapor and other organic substance films). Thus, the purpose of the present study was to distinguish and investigate films of the last two types (the first two types can readily be identified for they do not disappear as a result of heating the specimen to 200-300°C). Several micrographs of typical contaminant films (spots) are reproduced. Some of their features are discussed. The results obtained indicate that it is feasible by means of an electron mirror microscope to detect and identify dielectric films only a few Angstroms thick and that the sensitivity of the electron mirror procedure is not inferior to that of the method of post-charge emission described by P.N.Chistyakov (Zhur.tekh.fiz.33,1395,1963). TITLE: Properties of thin Permalloy films obtained by cathodic  
sputtering

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 28, no. 9, 1964,  
1411-1415

TOPIC TAGS: thin film, thin Permalloy film, cathode sputtered film,  
sputtered film magnetic property

ABSTRACT: A study has been made of the magnetic characteristics (important for the magnetic memory-element operation) of thin Permalloy [79% Ni] films, varying in thickness from 300 to 1000 Å, deposited by cathodic sputtering on a glass substrate at 200°C with a magnetic field superimposed in the substrate plane. The results of the study showed that the coercive force  $H_c$  decreases with increasing film thickness. The rate of decrease is similar to, but higher than, that observed

Card 1/3

L 8813-65  
ACCESSION NR: AP4045291

in vapor-deposited films. The films deposited with a superimposed magnetic field of 150 oe had the lowest  $H_c$ . The dependence of the anisotropy field  $H_k$  on  $d$  was similar to that for  $H_c$ ; it decreased with increasing  $d$  and was at a minimum in films deposited with a superimposed magnetic field of 150 oe. A maximum  $H_k$  was obtained with a superimposed field of 235 oe. The film saturation induction  $B_s$  varied from 11,000 to 7000 gs, regardless of  $d$ . The hysteresis-loop rectangularity coefficient  $K = B_r/B_s$ , where  $B_r$  is the residual magnetization, deviates from unity with  $d$  increasing to 700 Å and beyond. The deviation is probably caused by a rather low anisotropy in films of such thickness. At the maximum reverse magnetic field  $H_r$  of 10 oe, the films required from 20 to 45 nsec for reverse magnetization. The reverse magnetization time decreased linearly with decreasing film thickness  $d$ . Electron microscopic examination showed that the films have a polycrystalline structure with an fcc lattice. Orig. art. has 5 figures.

TITLE: Disintegration of ceramics and glasses under ion bombardment Report, Tenth  
Conference on Cathode Electronics held in Kiev, 11-18 Nov 1963

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.9, 1964, 1483-1487

TOPIC TAGS: ion bombardment, glass, ceramic, surface geometry, structural property

ABSTRACT: The destruction of the surfaces of glass and ceramic materials by ion bombardment is discussed in general terms on the basis of experimental material previously published by G.V. Spivak and collaborators, and some new experimental material. The samples were bombarded in an apparatus previously described by G.V. Spivak, F.F. Kushnir and V.Ye. Yurasova (Izv. AN SSSR, Ser. fiz. 23, 744, 1959; 25, 707, 1961) and were heated to temperatures as high as 1200°C. The discussion is illustrated with six optical and electron micrographs of bombarded surfaces. In some cases a grain structure could be perceived on the surface, the regions between the grains being eroded to a different extent than the grains themselves. Obliquely incident ions produced furrows having nothing to do with the structure of the material. It is

1/2

L 10612-65  
ACCESSION NR: AP4045305

concluded that features of the eroded surface are frequently due to the uneven ion current distribution arising from an uneven distribution of surface potential, rather than to structural factors. In the case of multi-component ceramics, and particularly glass ceramics, structural transformations can occur in the surface layer of the sputtered specimen, and evidence of such transformations can be perceived in the damaged surface. TITLE: Concerning thin films prepared by cathod sputtering of ferrites /Report,  
Second All-Union Symposium on the Physics of Thin Ferromagnetic Films held in  
Irkutsk, 10-15 July 1964/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 4, 1965, 626-628

TOPIC TAGS: ferromagnetic thin film, ferrite, cathode sputtering

ABSTRACT: In view of the fact that cathode sputtering has been reported (G. V. Spivak, I.G.Sirotenko, and R.D.Ivanov, Izv. AN SSSR, Ser. fiz. 25, 581, 1961) to conserve the exact chemical composition of the initial material, this technique was employed to prepare films of the monoferrites  $\text{NiO}\cdot\text{Fe}_2\text{O}_3$ ,  $\text{CuO}\cdot\text{Fe}_2\text{O}_3$  and  $\text{CoO}\cdot\text{Fe}_2\text{O}_3$ . The resultant films were investigated to determine their structural and magnetic properties, which properties were then compared with those of the parent materials. Debye x-ray patterns were recorded to determine the crystal structure of the starting ferrites. The films were deposited on polished glass and on cleaved NaCl. Films of optimum thickness (300 Å) were examined in a transmis-

Card 1/2

L 50964-65

ACCESSION NR: AP5011445

2

sion electron microscope; in addition, electron diffraction patterns were recorded. Some of the diffraction patterns and micrographs are reproduced. The sputtering was realized in a setup with a thermal cathode providing an intense (about 3 A) discharge in xenon at a pressure of  $5 \times 10^{-3}$  torr. The specimen was connected at the third electrode. In view of their high resistance the ferrite specimens were coated on one side with silver to provide good electrical contact. Some thermal effects were noted, so that in general the film specimens were not identical in structure and parameters with the parent materials. The magnetic properties of the ferrite films were investigated in more detail by Galegov, who presented a report on the subject at the Irkutsk Symposium. Orig. art. has: 3 figures.

TITLE: On formation of Permalloy films by means of a high-vacuum ion source  
Report, Second All-Union Symposium on the Physics of Thin Ferromagnetic Films  
held in Irkutsk 10-15 July 1964

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 4, 1965, 629-633

TOPIC TAGS: ferromagnetic thin film, permalloy, ion source

ABSTRACT: The purpose of the work was to explore the feasibility of preparing thin films by means of a high-vacuum ion source. In principle the technique should allow of preparing films of any desired thickness and configuration without use of a mask and without danger of extraneous impurities. Moreover, the ion-source procedure has the potentiality of automation for purposes of series production of "standard" uniform films. The equipment employed for the experiments was the high-vacuum ion source installation developed in the authors' laboratory and shown schematically in the Enclosure. The design, operation and various parameters of the ion source installation are described and discussed. A number of curves

Card 1/3

L 50977-65

ACCESSION NR: AP5011446

O  
characterizing the variation of the ion current to the collector as functions of different factors (temperature, potential, electron beam current, etc.) are reproduced. Film preparation experiments were run with Permalloy. So far, in two hours operation there was obtained a 250 Å thick film, electron diffraction patterns from which indicate that its composition is at least similar to that of the initial Permalloy. Mass-spectroscopic studies are planned for the future to check the composition of the ion beam. Orig. art. has: 9 figures.

TITLE: Magnetic properties of Permalloy films formed in ion bombardment /Report,  
Second All-Union Symposium on the Physics of Thin Ferromagnetic Films held in  
Irkutsk 10-15 July 1964/

SOURCE: AN SSSR. Izvestiya Seriya fizicheskaya, v. 29, no. 4, 1965, 634-638

TOPIC TAGS: ferromagnetic thin film, permalloy, magnetic property

ABSTRACT: The work was undertaken in view of the growing use of thin films in electronics and the consequent need for new and better film preparation techniques. Preparation of films by ion bombardment has a number of distinctive features and advantages (G.V.Spivak, V.E.Yurasova, O.A.Rozhkova, and T.N.Nikitina, Izv. AN SSSR, Ser. fiz., 28, 1411, 1964, and other papers by the Spivak group). Primary among these is good correspondence of the composition of the film with that of the initial, sputtered material. One of the objections to the ion bombardment technique is that inert gas atoms, present in the discharge chamber, become imbedded in

Card 1/3

L 50992-65

ACCESSION NR: AP5011447

the film and impair its properties. In the present experiments a series of films of different types of Permalloy were prepared in glow and arc discharges in an inert gas atmosphere. The orienting field was provided by a pair of Helmholtz coils. The substrates were glass, glass precoated with quartz, aluminum, aluminum cleaved by ionic etching, and rock salt. The substrates were washed before installation in the apparatus and then further cleansed by the discharge before deposition of the films. The films were investigated as regards some of their magnetic properties and subjected to chemical analyses for comparison with the analytic composition of the initial sputtered materials. Electron micrographs and electron diffraction patterns (one of each is reproduced) indicate that the Permalloy films were polycrystalline with a fine-crystal structure. The films on uncleansed Al were of poor quality, but those on cleansed Al were similar to films deposited on glass. Some magnetic data on the films, including curves of the inverse switching time versus switching field, are given in tables and figures. The results show that given proper control of the sputtering conditions and parameters it is feasible to prepare by this technique Permalloy films with characteristics similar to those of films prepared by thermal evaporation; the attainable reproducibility is satisfactory: for example, the scatter of coercive force values in a series of films was less than 10%. "In conclusion, we express

TITLE: Observation of transient processes in silicon diodes by means of a stroboscopic emission microscope /Report, Fifth All-Union Conference on Electron Microscopy held in Sumy 6-8 July 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 749-753

TOPIC TAGS: electron microscopy, silicon diode, pn junction

ABSTRACT: In the introductory paragraphs note is made of the advantages of employing a stroboscopic or gating electron microscope for studying transient processes in semiconductors and observing the dynamics of microfields. In the work described in the present paper the stroboscopic microscope diagramed in the preceding report by the authors (see Abstract AP6015755) was used to observe the individual phases of establishment of direct current flow in silicon diodes. It is pointed out that the time resolution of the given electron microscope approaches the nanosecond range. A special simple resistance-capacitance circuit with a vacuum tube was employed to provide the

Card 1/2

L 27641-66

ACC NR: AP6015756

requisite dc pulse repetition rate. Micrographs of the surface of a diffused silicon diode, of a p-n junction in a mesa-diode under - 40 V bias and of a section of an alloyed diode are reproduced in the text together with oscillograms of the dc pulse and the transient process in the case of one experiment. The effects revealed by the micrographs are discussed. Further experiments were concerned with investigating the influence of temperature on the structure of a p-n junction; the results are very briefly described: heating to 260°C resulted in a 200 ohm reduction of the back resistance of the diode. The authors are grateful to A.E. Yunovich for discussion of the results. [15]

TOPIC TAGS: optic conference, electron microscopy, germanium, silicon, microscope, lead compound, sulfide, selenide, cadmium sulfide, ferromagnetic material, exitaxial growing, PN junction, crystallization, polymer, semiconductor device

ABSTRACT: Applications of electron microscopy in physical, chemical, metallurgical, technological, biological and medical fields, electron optics and instrument manufacture were the general topics of about 250 papers presented at the Fifth Conference on Electron Microscopy. The conference was held 6-9 July 1965 in Sumy. In the field of physics, papers on the structure of thin films were of scientific interest. Papers in this category discussed the effect of electron irradiation on the crystal structure of vacuum condensed germanium and silicon (A. N. Pilyankevich, V. P. Zakharova, and V. N. Chugayev); formation of chemically deposited lead sulfide and

Card 1/3

lead selenide films (V. N. Vertsner, L. N. Biller, et al.); epitaxial growth of various (unnamed) films (L. S. Palatnik, V. M. Kosevich, V. M. Moskalev, et al.); vacuum condensation of CdS films (R. D. Ivanov, B. D. Galkin, V. N. Bunarev, et al.); and structure of thin ferromagnetic films (L. V. Kirenskiy of the Krasnoyarsk Institute of Physics, Siberian Department, AS USSR).

In the series of papers on instrument manufacture and electron optics, P. A. Stoyanov, E. A. Shulyak, V. N. Kaplichnyy, and other staff members of the Sumy Plant of Electron Microscopes and Electrical Automatic Equipment discussed an improved version of the UEMV-100 microscope; V. S. Gurin, G. D. Kisel', and V. M. Yaremenko reported on a new MES-100 microscope.

In the chemistry section, a study of great scientific interest was presented by G. I. Distler on the structure of the p-n junction in semiconductors by means of newly developed decoration techniques. Papers were also noted on a recently developed method of low-temperature etching to reveal morphological forms of polymers (V. M. Luk'yanovich), and

TITLE: A stroboscopic secondary-emission electron microscope /Report, Fifth All-Union  
Conference on Electron Microscopy held in Sumy 6-8 July 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 742-748

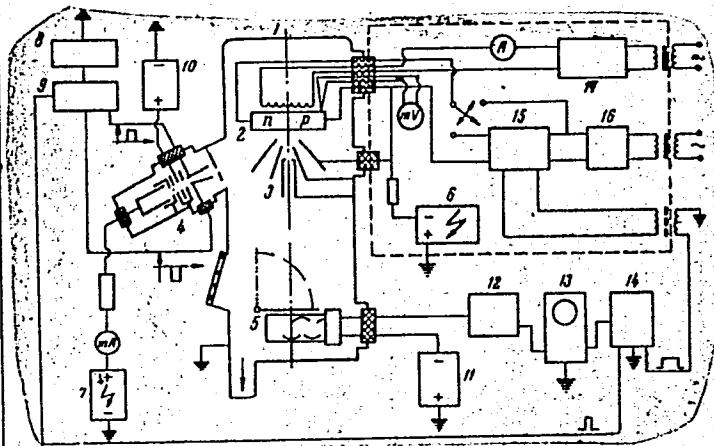

TOPIC TAGS: electron microscope, electron microscopy, silicon diode

ABSTRACT: The purpose of a stroboscopic or gating electron microscope is to observe  
the successive quasi-instantaneous stages of dynamic processes; if the frequency of  
the investigated process is synchronized with the gating there will be obtained sta-  
tionary images of the surface structure regardless of the frequency characteristics of  
the screen. In the case of an emission system with a three-electrode objective a  
stroboscopic regime can be realized in different ways: supply of the microscope with  
high-voltage pulses, modulation of the potential on the focusing electrode, or deflec-  
tion of the beam by means of appropriate deflecting plates. In the instrument employ-  
ed in the present work pulse modulation was employed (V.G.Dukov, G.V.Spivak, N.N.Sedov,  
and V.V.Evdokimov, Proc. III Europ. Conf. on Electron Microscopy, V.A., p. 283,  
Prague, 1964). A block diagram of the microscope and associated electronic equipment

is shown in the figure. Some of the parameters of the equipment and particularly of the ion source used for inducing the secondary emission are described in the paper. The microscope was used for investigation of a number of transient processes on the surface of semiconductors, junctions, and the like. Static and stroboscopic micrographs of the surface of a diffused silicon diode are reproduced; in the stroboscopic regime there is revealed (as a dark band) the region of potential drop in the base of the diode. Orig. art. has: 6 figures. [15]

Shaping 8/22/59*

379. Mechanization of repressing "star" bricks and runner bricks.—I. V. SIVAK (Ogneupory, 16, 174, 1949). In 1946 the author proposed a mechanical press for repressing runner bricks and in 1947 one for "star" bricks. Both presses are of fairly simple construction, are easily operated, and give a high output. One press produces 13,000 runner bricks per shift and the other 2,000 "star" bricks per shift. Each press requires two workers. It has been decided to introduce these presses throughout all Russian plants making casting-pit refractories. The structure of both presses is described in detail. (8 figs.)

1148. The Sivtak press for end runner bricks.—I. V. SPIYAK (Oryazhpur, 16, 430, 1951).  
The press is for re-pressing end runner bricks of all types from an extruded blank. The  
merits of the press are: high efficiency (17 strokes/min.); devices for regulating the  
size of the product; all types of end runners can be pressed in one mould. (4 figs.)

Influence of the application of gypsum on the conversion  
of phosphates in saline soils. P. O. Dmitrenko and Kh. S.  
Spivak. Dopovidil Akad. Nauk Ukr. R.S.R. 1956, 694-7.  
Barley was planted and the H<sub>2</sub>O-sol., citrate-sol., and insol.  
P<sub>2</sub>O<sub>5</sub> were analyzed at soil depths of 0-20, 20-40, and 40-60  
cm. The application of gypsum (I) means that the P be.

comes more available to the plants, yet its mobility is de-  
creased. This phenomenon is especially pronounced at  
40-cm. depth. It is explained that a series of reactions  
takes place. I also decreases the amt. of H<sub>2</sub>O-sol. Na and  
Fe, so that actually the whole soil equill. is upset.

TITLE: Thermodynamic properties of non-aqueous electrolyte solutions.  
XIV. Calculation of the transport energy of acids from one solvent  
to another

PERIODICAL: Zhurnal fizicheskoy khimii, V. 37, No. 4, 1963, 822-828

TEXT: The values for  $\Delta pK = \lg K_{H2O} - \lg K_M$  of various acids in alcohols, ammonia, and formic acid are compared with those for  $\lg \gamma_{H^+}$ , the transolvation energy of the proton. The changes in the transfer energy of acid anions and of non-dissociated acids are calculated from solubility data. On the basis of the results which are obtained an attempt is made to calculate the values for  $\Delta pK$  from the change in transfer energy of the proton ( $\lg \gamma_{H^+}$ ), anion ( $\lg \gamma_{A^-}$ ), and non-dissociated molecules ( $\lg \gamma_{mol}$ ). It is shown that these data may serve for the estimation of the change in strength of the acids on passing from one solvent to another. There are 6 tables.

TITLE: Effect of ultrasonic vibrations on the isothermal decomposition of KhVG  
austenitic steel 1/6

SOURCE: AN SSSR. Izv. otd. tekhn. nauk. Metallurgiya i gornoye delo, no. 2,  
1963, 124-129

TOPIC TAGS: austenite decomposition, tool steel, ultrasound effect, residual  
austenite, hardness

ABSTRACT: Specimens (30-mm long, 9 mm in diameter) of KhVG tool steel (0.95% C,  
1.1% Mn, 0.24% Si, 1.22% Cr, and 1.58% W), annealed in a salt bath at 1000 or  
900C for 20 min, were transferred to other baths with temperatures of 250 or 450C,  
held for 2 min, and then subjected to ultrasonic vibrations with a frequency of  
20.5 kc at amplitudes of 3, 10, or 18 $\mu$  applied directly to specimens for 10 to  
120 min. In specimens annealed at 1000C, ultrasound at an amplitude of 3, 10, or  
18 $\mu$ , applied for 10, 30, 60, or 90 min at 250C, was found to refine martensitic

Card 1/3 ✓

L 10791-63  
ACCESSION NR: AP3000913

structure. The amount of residual austenite and hardness ( $R_c = 62-63$ ) were not affected. Ultrasound at 10 and  $18\mu$  amplitude, applied at 250C for 60 or 120 min, accelerated the decomposition of austenite in specimens annealed at 900C, while ultrasound at  $3\mu$  amplitude applied under the same conditions delayed the decomposition. In the same specimens, only ultrasound at an amplitude of  $18\mu$  applied for 60 and 120 min increased the hardness by 2-3 and 5-6  $R_c$ . Ultrasound applied for 15 or 30 min at 450C to specimens annealed at 1000C did not affect the decomposition of austenite. Longer (60, 90, or 120 min) treatment with ultrasound at an amplitude of 10 or  $18\mu$  delayed decomposition and increased hardness by 6 to 7  $R_c$ . Decomposition of austenite in specimens heated to 900C and treated with ultrasound at 450C generally followed a pattern similar to that observed in the previous case, except that decomposition started after treatment for 15 min and hardness increased by only 2-3  $R_c$ . Ultrasound at a  $3\mu$  amplitude accelerated the decomposition. Thus, in isothermal decomposition of austenite, ultrasonic vibrations at an amplitude of 10 or  $18\mu$  increase the stability of austenite at 450C, but lower it at 250C, while amplitudes of  $3\mu$  have the opposite effect.

TITLE: Effect of ultrasonic oscillations on carbide grain formation during annealing of quenched carbon steel 25  
16 19

SOURCE: Fizika metallov i metallovedeniye, v. 17, no. 4, 1964, 624-627 B

TOPIC TAGS: annealing, quenching, ultrasonic vibration, carbon steel/U12 steel

ABSTRACT: The effect of ultrasonic oscillations on carbide formation was investigated in U12 steels during annealing at 680°C. The 10-mm diameter steel specimens were quenched from 960°C temperature in oil and screwed on the waveguide of a magnetostrictive vibrator. At 20.5-kc frequency standing waves of  $10\mu$  amplitude were created in the specimen. After the test, longitudinal sections were sliced off from the specimen and the microstructure was analyzed at 2000 magnification. After 1 hour of annealing and ultrasonic oscillations, the microstructures indicated, on the average, larger carbide particle sizes with greater distances between each carbide particle than in the control specimens. A graphical plot of the number of carbide particles versus annealing time shows that the effect of

Card 1/2

L 27261-65

ACCESSION NR: AP4034064

ultrasonic oscillations first increases, reaches a maximum, and subsequently decreases. For a given test duration time, the particle distribution falls sharply from the end of the specimen until it reaches a constant value at a distance of 40 mm. These results show that ultrasonic oscillations promote coagulation of carbides in U12 steels. Orig. art. has: 4 figures.

TITLE: Isothermal decomposition of the austenite of KhVG steel in an ultrasonic field

SOURCE: AN SSSR. Izvestiya. Metally, no. 3, 1965, 123-127

TOPIC TAGS: isothermal decomposition, decomposed austenite, supercooled austenite, ultrasonic vibration, bainitic structure

ABSTRACT: The present work is a continuation of a previous investigation which showed that ultrasonic vibrations exert a definite and not always unambiguous effect on the decomposition of supercooled austenite of KhVG steel (0.99% C, 0.25% Si, 0.25% Mn, 0.018% P, 0.019% S, 1.03% Cr, 0.15% Ni, 1.56% W): at 450°C the vibrations with amplitudes of 10 and 18  $\mu$  increase the stability of the austenite while at 250°C they contribute to its decomposition. These findings were obtained on the basis of a qualitative comparison of the microstructures and roentgenograms of specimens with and without exposure to the ultrasound. In this connection, it was of interest to investigate the effect of ultrasonic vibrations on the isother-

Card 1/2

L 63331-65

ACCESSION NR: AP5017472

mal decomposition of austenite over a broader range of temperatures and to establish quantitative ratios. Accordingly the authors exposed specimens of this steel to ultrasonic vibrations with  $18 \mu$  amplitude in salt baths at temperatures of 700, 550, 500, 450, and 300°C. Transverse microsections of the specimens taken at the sites of maximum stresses were subjected to diffraction studies at room temperature. The amount of undecomposed austenite was estimated according to the reflexes (111) of austenite and (110) of alpha-phase. In addition, the microhardness of the decomposition products was determined by plotting frequency curves on the basis of measurements for every individual case. Microstructural examination revealed that ultrasonic vibrations in different temperature regions differently affect the austenite. At 700°C they inhibit the decomposition of austenite; at 550°C they lead to a reduction in the amount of residual austenite in specimens cooled to room temperature, while at 450°C they produce an opposite effect, and at 300°C they contribute to the decomposition of austenite. This is attributed by the authors to the mechanism of transformation in each temperature region. For supercooled austenite the effect of ultrasonic vibrations is expressed in the form of a finer bainitic structure. Orig. art. has: 5 figures.

TITLE: Effect of ultrasonic vibration on austenite grain growth during annealing

SOURCE: IVUZ. Chernaya metallurgiya, no. 6, 1965, 127-130

TOPIC TAGS: steel, steel treatment, austenite grain, grain growth, ultrasonic treatment/U12 steel

ABSTRACT: The effect of treatment by ultrasonic vibration at 20.5 kc on the grain growth during subsequent annealing in austenite of U12 steel (1.15% C, 0.20% Mn, 0.32% Cr, 0.25% Si) has been investigated. Specimens 10 mm in diameter were treated with ultrasound at 850, 900, or 950C for 10—40 min, air cooled, and then annealed at 900—1200C for 4 hr. It was found that the grain size of specimens treated with ultrasound is, as a rule, larger than that of untreated specimens. Electric resistivity increases under the effect of ultrasound, which weakens grain boundaries and lowers strength and ductility

Card 1/2

L 55140-65

ACCESSION NR: AP5015823

However, subsequent annealing restores the strength and increases the elongation 15—20% over that of untreated specimens. Ultrasonic treatment followed by annealing changes the grain boundaries of austenite and increases the space between pearlitic lamellae. It reduces the rate of austenite grain growth during high-temperature annealing and lowers the microhardness of annealed specimens. The effect of ultrasonic vibration may be explained by the formation of submicroscopic distortions at grain boundaries which absorb various impurities. Orig. art. has: 5 figures. [ND]

ABSTRACT: The author generalizes the notion of a coordinate structure as a set of coordinate systems. He considers the mappings of an arbitrary set A into an arbitrary set B instead of the mappings of the geometric space into an arithmetic space, and he calls the sets of such partial one-to-one mappings atlantes. He forms an axiomatic of certain types of atlantes, where the axioms are set-theoretical properties of the coordinate structures of the spaces of Veblen-Whitehead [Ref 3], Klein, etc. Furthermore the geometric objects of Klein and differential-geometric objects (in the sense of Wagner [Ref 4]) are subordinated to the more general notion of the associated atlantes. Hereby some generalizations of the assertions of Wagner [Ref 4] are obtained.

TITLE: Interpretation of the theory of automata by methods of the theory of proportions

SOURCE: Problemy\* kibernetiki, no. 12, 1964, 69-97

TOPIC TAGS: automata theory, logic circuit, abstract machine, homomorphism

ABSTRACT: An automata system is described as having three state descriptors X, S, and Y, which represent states of input, internal, and output devices, respectively. A state of an input device at a given moment,  $x(t)$ , is determined by an external condition. The state of the internal device at a given moment,  $s(t)$ , is a function of the state of the input device at that moment and a function of the state of the internal device at the preceding moment. The state of the output device  $y(t)$  is a function of the simultaneous state of the internal device. The author considers the system of objects  $(X, S, Y, \delta, \mu)$  to be an automat with input signal descriptor X, condition (state) descriptor S, output signal descriptor Y, transition function  $\delta$ , and output function  $\mu$ . Several basic results of the abstract theory of automata are presented, with emphasis directed to the synthesis of an

Card 1/3

L 18804-65  
ACCESSION NR: AT5000717

automaton according to given conditions. Preliminary treatment is accorded to notation and definitions within the automata theory. Binary relationships are symbolically defined for the operations of sectioning, projecting, transformation, product formation (union), and homologous union (reflective, symmetric, and transitive). Earlier work by S. Ginsburg (Some remarks on abstract machines, Trans. Amer. Math. Soc. 96, 3, 1960, 400-444) formed the basis of the theorem: "In order that an automat A be minimal it is necessary and sufficient that it be rigorously bound." The terminology is that of E. F. Mur (Umozritel'nye eksperimenty s posledovatel'nostnymi mashinami, Sb. "Avtomaty" IL, M., 1956, 179-212). A minimal automat is described in terms of a minimal stable subset of  $S_A$ . Necessary and sufficient conditions of a stable subset of  $S_A$  are detailed and proved. The automat A, if not bound, contains components termed subautomats. These subautomats are minimal automats themselves if the necessary and sufficient rigorous bounding relationship is its equivalence relationship. Homomorphism of two automats is discussed, the conditions of its existence, and the properties of homomorphism are listed. An automat A is defined as a monomorphic specimen of sums of free automats. Homomorphism is also discussed in the context of automat reaction and in two related problems. The properties of the canonical form are given, and five theorems are stated and proved in the theory of automat synthesis.

of regular expressions

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 1, 1965, 51-57

TOPIC TAGS: automaton, automaton synthesis

ABSTRACT: The problem is considered of the abstract synthesis of an automaton whose working conditions are written in the regular-expression language that contains, in addition to conventional symbols, the signs ∩ and ' which denote intersection and supplementing of events. As the abstract-synthesis algorithm given by R. F. McNaughton et al.(IRE Trans., EC-9, 1960, no. 1) cannot be directly extended over the expanded regular-expression language, the author suggests a new algorithm based on an expansion of the regular expression into a

Card 1/2

L 44758-65

ACCESSION NR: AP5007250

set of other regular expressions (the "basis"). It is also pointed out that the new algorithm permits the inclusion of other operations in the future. Orig. art. has: 4 figures and 16 formulas.

TITLE: The algebraic characteristic of the calculational power of an automaton

SOURCE: Kibernetika, no. 4, 1965, 1-11

TOPIC TAGS: automaton, information processing, mathematic model, calculator,  
algebraic logic *Nr. 447,85*

ABSTRACT: The author defines an automaton as a discrete converter of information. K. B. Krohn and J. L. Rhodes correctly defined in their paper (Proc. Sympos. Math. Theory Autom., New York, N. Y. 1962, Brooklyn N. Y., Polytechn, 1963, 341-384) the relative calculational power of automata. However, the algebraic characteristic of the relative calculational power given by these authors is not correct. The basic aim of the present paper is the establishment of the correct algebraic characteristic of the relative calculational power of automata. Following the definition of the mathematical model of the automaton and the characterization of the information conversion by means of the reaction concept, the author introduces the concept of reaction divisibility, extends this concept

Card 1/2

C 7010180

L 27898-66

ACCESSION NR: AP5024537

to sets of reactions, associates the sets with abstract semigroups, and introduces the concept of fitted semigroups representing (G, E) pairs (E - the set of equivalent relationships over the semigroup G). Such a fitted semigroup of the reaction set characterizes effectively the calculational power of the set of reactions.. Orig. art. has: 125 formulas and 2 figures.
