"Some Special Problems in Ophthalmoneurologic Diagnosis."

Prague, Ceskoslovenska Neurologie, Vol 26(59), No 3, May 63; pp 201-209.

Abstract [English summary modified]: Detailed discussion of papilledema, choked disc, optic neuritis and pseudoneuritis which author saw in 8 young myopic patients with treatment-refractory headaches as only symptoms. Precise diagnosis and prognosis may require not only photographic comparison of papillae at different times, but also microscopy and examination of parents and siblings. Four photographs, graph, 10 Czech and 44 Western references.

Vapor-phase purification of cracked gasoline with clay. P. T. Syrigil. *Rabochii Neftyanik* 1938, No. 6, 15-18; *Khim. Referat. Zhur.* 2, No. 4, 117 (1939).—Experiments performed in the Odessa cracking plant showed that the vapor-phase purification of cracked gasolines with Zakrev clay according to the method of Gray was much more profitable than the purification with  $H_2SO_4$ . Losses of gasoline were reduced and the technology of the method was much simpler. Instead of alkali for washing the gasoline (to improve the Cu strip test) the Odessa plant successfully used sea water. More stable gasolines for storing were obtained. W. R. Henn

APPROVED FOR RELEASE: 08/31/2001

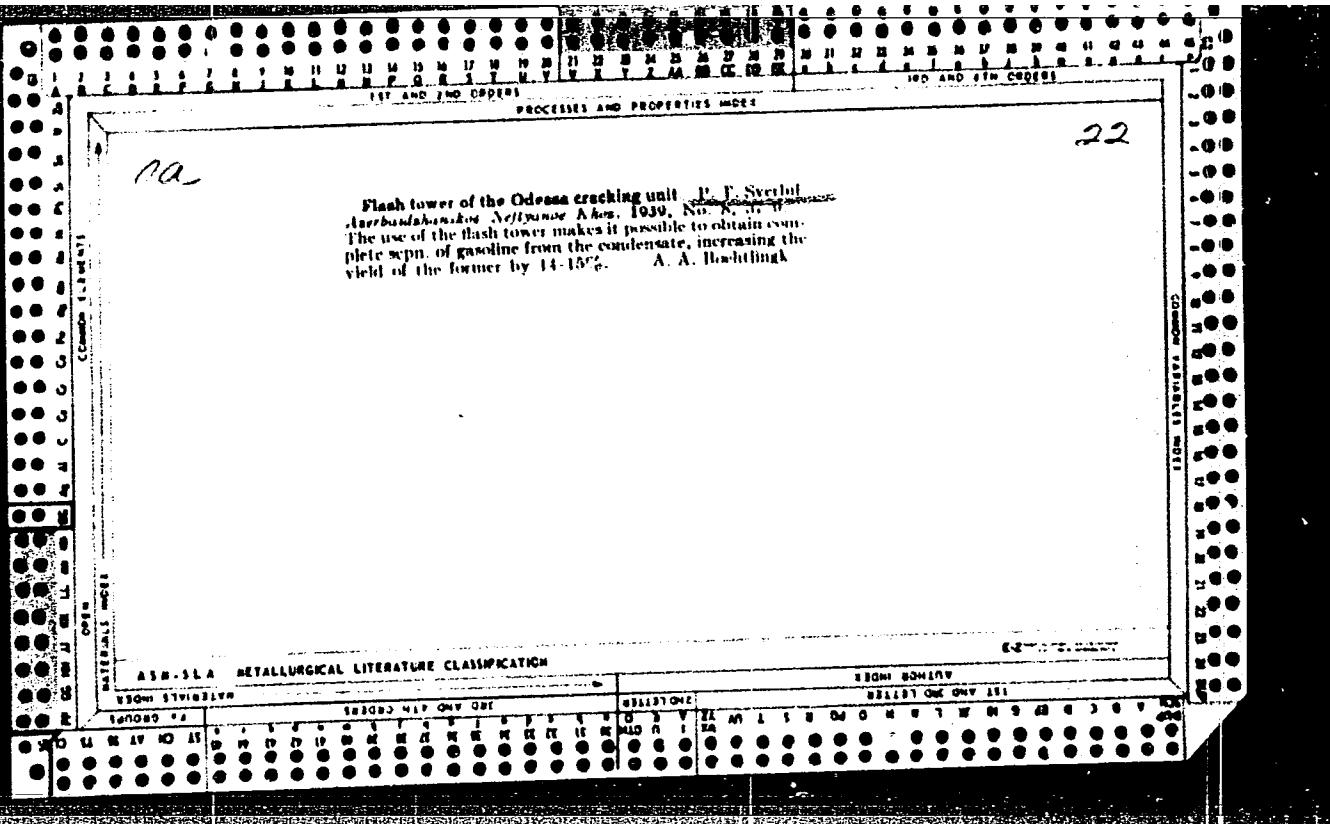

CIA-RDP86-00513R001654110019-3"

Vapor-phase treatment of cracked gasoline with bleaching earths. I. T. Sizikov and A. M. Rakivkovich. *Neftegaz. Khoz.*, 1938, No. 3, 41-6.—Vapor-phase treatment of cracked gasoline with clay has many advantages as compared with  $H_2SO_4$  treatment. Thus losses in the gasolin yield, when using the flash-tower system, increase up to 34-37% caked, on the original raw material. The Zilkeev clay gives quite satisfactory results in recycling up to 60 days, its consumption amounting to 0.3-0.4% on the finished gasoline. The refinery-scale treated gasolines pass the copper strip test when washed with 2-2.5 vol. of water in 2 stages. The water treatment affects the inhibitors to a much smaller extent than alkali treatment. The induction period of gasolines treated in the above manner is usually over 240 min., being independent of the amount of clay spent. The amt. of gum after 2 months storage in a glass container when exposed to air and light is of the magnitude of 10 mg. Cracked gasolines from the Odessa cracking unit when treated with 1% of  $H_2SO_4$  have a higher induction period than vapor-phase-treated gasolines. The latter, when stabilized with 0.013% naphthol or 0.005% of the wood-tar fraction, have an induction period of 160-565 min. The epoxides are described. A. A. Bochtingk

To Solve More Actively the Tasks Set by "Letter И-100"  
(Aktivnaye reshat' zadachi, postavlennyye "Pis'mom И-100")  
We Do Practical Training in Workshops (Prakticheskiye  
zanyatiya provodim v tsekhakh)

PERIODICAL:

Vestnik Vysshey Shkoly, 1957, # 7, p 60-62 (USSR)

ABSTRACT:

The author gives the results of "Letter И-100", basing his data on the material gathered by the Chair of Industrial Economics of the Kiyev Financial Economic Institute. This Chair, in order to create conditions for independent student work, investigated the training program, which was found to be excessive. The author lists a number of courses which were cut to provide time for independent work and states that this will also prepare the ground for the creation of courses in synthetics, an important task which has to be carried out in the near future.

The above Chair also reorganized the laboratory work. Of the 80 hours provided for laboratory work in the second course of the Faculty of Industrial Economics (Technology of Machine Building) the students worked 54 hours in the mechanical workshop of the Kiyev Machine-Tool Building Works imeni

taken; thus interesting horizons from which frequently no core samples have been taken are covered by the map as well. Promising reservoir rocks exist in the region of Tyumen' and Omsk in the continental facies of Middle Jurassic and seem to extend in a narrow strip till Berezovo. Very promising reservoir rocks are on the periphery of the Lowland over a wide area and show the highest productivity values (Turinsk, Omsk, Petropavlovsk). A very favorable region lies also between the rivers Ob' and Irtysh, in the basin of the river M.Sos'va, in the middle course of the river Konda and in the middle and lower courses of the river Vakh. There are 2 figures and 4 Soviet-bloc references.

TITLE: Accurate Comparison of Neighbouring Frequencies by  
Means of Computing Systems (Tochnoye srovneniye  
blizkikh chastot pri pomoshchi pereschetnykh skhem)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,  
1958, Nr 4, pp 137-141 (USSR)

ABSTRACT: An equipment is described which permitted the frequency measurement with an error of  $10^{-10}$ , the duration of the measurement being of the order of a few seconds. The equipment is illustrated diagrammatically in Fig 1 on p 139. The measured frequency  $f$  and the frequency of a standard oscillator  $f_1$  are shaped into narrow "spiky" pulses by means of two identical circuits; each circuit contains a resistance capacitance amplifier, a pulse forming stage and a wideband pulse amplifier. The two pulse trains obtained in this manner are applied to a mixer-coincidence detector which is normally closed by a negative bias and is opened only when the two pulses coincide. The mixer-detector is terminated with an integrating RC

Card 1/3

Accurate Comparison of Neighbouring Frequencies by Means of  
Computing Systems

circuit which detects the envelope of the pulse beats. The envelope is amplified and limited and afterwards fed to the computing system, type PS-64, which divides the pulse repetition frequency by an even number  $n = 2, 8$  or  $32$ ; number  $n$  can be chosen so as to satisfy the required accuracy of the measurement. The output pulses from the computing system trigger an asymmetrical multi-vibrator. The voltage from the cathode of the multi-vibrator is applied to a gate circuit whose amplification is changed thereby stepwise by 30 db. The control grid of the gate tube is supplied with the pulses from an auxiliary oscillator  $f_0$ . Consequently the gate circuit transmits pulses of frequency  $f_0$  during a period  $nT$ . Afterwards the gate is closed for a duration  $nT$ . During the latter period the indication of the computer is read out and the computer then reset to zero. The measurement of the frequency  $f$  is done in accordance with the formula:

TITLE: Frequency Standard with a Molecular Oscillator (Reper chastoty s molekulyarnym generatorom)

PERIODICAL: Radiotekhnika i Elektronika, 1958, Vol.3, Nr 4, pp 569-570 (USSR)

ABSTRACT: Description and block diagram are given of a molecular oscillator which was employed for the calibration of quartz crystals operating at a frequency of 1 Mc/s. The frequency of the oscillator was compared with the 23,368th harmonic of the frequency of the investigated crystal and an accuracy better than  $10^{-9}$  was attained. There is 1 figure and 2 references, one of which is Soviet and 1 English.

TITLE: Model of a Caesium Frequency Standard

PERIODICAL: Radiotekhnika i elektronika, Vol 5, No 7, 1960,  
pp 1173-1176 (USSR)

ABSTRACT: In accordance with a recommendation of the Twelfth General Assembly of the International Radio Scientific Union the comparison of a molecular generator with a caesium standard within a single laboratory has been undertaken. Two models of an atomic frequency standard using an atomic caesium beam have been developed at the Institute of Radio Engineering and Electronics of the Academy of Sciences, USSR. In this system the ultra-fine structure in the atomic caesium spectrum is used, employing two closely located levels between which transitions occur at a frequency of about 9192 Mcs. In a weak magnetic field these levels are subjected to Zeeman splitting. The system consists of a copper tube 12 mm in diameter, 1200 mm long, in which a high vacuum is maintained. The magnetic field of the system is uniform to within 0.1 oe. The spectral line width is 300 cps, the signal/noise ratio about 100. There are 4 figures and 15 references of which 12 are English and 3 Soviet. ✓

voltages on the klystron electrodes, expressions are derived which define: (1) the power of the output signal of frequency  $f_{out} = nf_{in}$ , where  $f_{in}$  is frequency of the input signal; (2) the band width  $\Delta f$  in which a stable multiplication is obtained.  $\Delta f$  depends on the cathode current, the reflector voltage, and on the factor  $n$ . The block diagram of an experimental installation for frequency multiplication is shown on Fig. 1.

Card 2/5

Fig. 1.

Frequency Multiplication by a Large Factor  
Using a Reflex Klystron

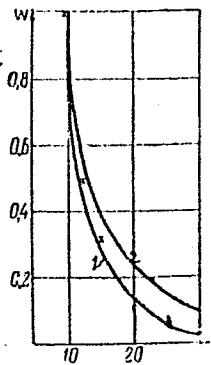

77565  
SOV/108-15-2-10/12

Here the input signal from the generator (1) is supplied through the measuring line (2), the attenuator (3), and through a coaxial line to the reflector of klystron (4). The klystron output signal passes through the attenuators (5) and (7) to the spectrum analyzer (6) and power measurer (8), respectively. The klystron operates as a regenerator. The klystron resonator is tuned to the  $n$ -th harmonic of the input signal. In the above installation, a standard 3-cm-wave klystron was used and frequencies  $f_{out} = nf_{in} = 9,000$  to 10,000 Mc were obtained. The relationship between the output power and the multiplication factor  $n$  is shown on Fig. 2, where the power for  $n = 10$  is assumed to be equal one.

Card 3/5

Frequency Multiplication by a Larger Factor  
Using a Reflex Klystron

SOV/108-15-2-10/12

Card 4/5

Fig. 2

Frequency Multiplication by a Larger Factor  
Using a Reflex Klystron

77565  
SOV/108-15-2-10/12

Here the curve (1) is obtained experimentally; the curve (2) is plotted according to the theory. For the considered 3 cm wave,  $\Delta f$  was 3 to 15 mc, the experimental and theoretical results showing a good coincidence. At  $n = 30$ , an output power of the order of 500 to 1,000 microwatts may be obtained. The author arrives at the conclusion that the suggested multiplication method is extremely simple and reliable. The power of the output oscillation is relatively high. There are 4 figures; and 4 Soviet references.

ABSTRACT:

The Nauchno-issledovatel'skiy sektor Gidroproyekta (Scientific Research Section of the Gidroproyekt) has carried out research into the washing-off of dam banks, which are not covered with a protective filter. Using models, studies were conducted on the penetration of the bottom soil into the pores of the dam bank and its diffusion in the bank prism and into the sediments behind the bank. Based on the completed research, it has now been decided to heap up pebbles on the bank in the provisional run part of the river bed dam, simultaneously placing concrete pyramids and cubes on the bank. The fine pebbles will fill the gaps between the pyramids and cubes, and thus the underwa-

Extracardiac Factors in Changes in It

Orig Pub : Izv. AN KazSSR, Ser. med. i fiziol., 1957, No 1 (8), 3-32

Abstract : In acute experiments on 83 dogs and 18 rabbits, recordings were taken of the blood pressure (BP), the venous pressure (VP), and the respirations. Introduction of CO<sub>2</sub> into the upper respiratory tract and asphyxia elicited increases in BP and, in the majority of cases, in VP. The latter effect disappeared upon removal of the sucking action of the thoracic and abdominal cavities by opening these cavities, and, in a number of experiments, following transection of the vago-sympathetic and sympathetic trunks.

second-order differential equation, Cauchy problem, automatic-control system,  
relay-control system, time optimum problem

ABSTRACT: In earlier works, the hypersurface of sign-changing of the relay  
element was obtained as a nonlinear function of phase coordinates of the  
controlled system. In this article, a relay-type control system is considered

Card 1/2

ACCESSION NR: AP4002857

whose linear part is described by a second-order differential equation with an arbitrary-root characteristic equation. Synthesizing a quick-response-optimized control is based on a phase-space method using a speedy simulator for plotting the optimum switching curve. "Experimental investigations showed a satisfactory operation of the system with the processes in the controlled system very near to optimum." No description of any experiments is given. Three oscillograms of transients in the controlled system show the system output variable, its derivative, and the control signal at the input. Orig. art. has: 5 figures and 18 formulas.

TITLE: A photometric photoelectric microscope

SOURCE: USSR. Komitet standartov, mer i izmeritel'nykh priborov. Trudy institutov Komiteta, no. 78(138), 1965. Issledovaniya v oblasti lineynikh izmereniy (Research in the field of linear measurements), 43-48

TOPIC TAGS: photoelectric microscope, photoelectric method, photoelectric tracking, optic scanning, photoelectric scanning, automatic scale, reading equipment, metrology

ABSTRACT: A photoelectric, line reading microscope is described. The block diagram of this instrument is shown in Figure 1. Scale 10 is illuminated by the light source 3 through the beam splitter 2 and the objective 1. The scale plane is imaged by the relay lens system 4 into the plane of the optical chopper 5 (in the form of a vibrating split) driven by two electromagnets. A photodetector 6 receives the light from the optical scanning system and generates electrical signals proportional to the instantaneous values of the light flux. The photodetector output is amplified in the amplifier 7 and demodulated in a phase sensitive ring demodulator 8. The resulting dc signal, proportional to the displacement of the microscope main axis from the center of

Card 1/3

ACC NR: AT7000580

the line being scanned, is displayed on a zero-center meter. When the instrument is properly calibrated and is operating correctly, the meter will indicate zero when the microscope axis coincides with the center of the line. The vibrating slit is driven at line frequency (50 Hz), hence the output of the photodetector (6) contains a fundamental frequency component at that frequency, as well as the second and higher harmonics. Since both the line image and the vibrating slit affect the light flux to the photodetector, the ratio of the second (and other even harmonics) to the fundamental (and other odd harmonics) depends on the relative position of the microscope optical axis to the center of the line. As the center of the line is approached this ratio increases until at coincidence no fundamental component is present in the signal. The phase of the fundamental with respect to the phase of the line frequency corresponds to the relative position--to the left, or to the right--of the scanning system with respect to the scale line. The ring demodulator, because it uses line frequency as reference,

TITLE: A generator for normal distributions of random numbers for a Ural-1  
electronic computer. Class 42, No. 169290

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 6, 1965, 73

TOPIC TAGS: normal distribution, random number generation/ Ural 1 electronic  
computer

ABSTRACT: This Author Certificate presents a generator of normally distributed  
random numbers for a "Ural-1" electronic computer. The generator includes an  
equally probable data unit and is designed to increase the generation speed of  
normally distributed numbers. It contains "I" circuits with their inputs connected  
to the reference number register, whose outputs are connected to the machine adder.  
The generator also contains a control circuit with the respective orders of the  
adder connected in series to the adder. The input of the adder is connected to  
the output of the first adder and the outputs of the adders are  
connected with the corresponding elements of the generator.

and many other contributions. In particular, recording has made possible an increase in the number of observations by a factor of 10 to 100 times for the

It is of great value to build and mount each separate head with tolerances within 10-20  $\mu$ . This is important as it is necessary to have a certain degree of alignment in the reproduction and mounting of such heads. On the other hand, in the presence of such a large number of recording heads, there is no need for separate access to each unit, the recording unit may be monolithic and even hermetically sealed thus increasing its reliability. The paper discusses certain constructive
