"Fatal Aplastic Anemia During Treatment with Chloramphenicol."

Belgrade, Medicinski Glasnik, Vol 16, No 10-12, Oct-Dec 1961; pp 446-448.

Abstract: Case in 52-year-old retired carpenter with chronic bronchial asthma, long treated with many drugs; eventually he received an "X" for chloramphenicol 1 gram daily [apparently for bronchial asthma or some hypothetical infection underlying it?] which he continued to take for 3 months; sudden appearance of purpuric lesions, reticulocytes 1%; 15 liters of whole blood transfused during 4 months, corticosteroids and other treatment all failed to save him; complete toxic aplasia of all hematopoietic tissues. (Author's Western, 3 Yugoslav references).

SVR DLIK, M.

AUTHOR: Kubec, Z. and Sverdlik, M. CC/8/52(82)/10-38/39
 TITLE: All-quartz Apparatus for the Determination of Fluorine by Means of Pyrolysis (Kremenný pílestrový přístroj k prohydrolytickému stanovení fluoru)

PERIODICAL: Československý listy (Czechoslovakia) 1958, Vol 52(32), Nr 10, pp 2018-2021

ABSTRACT: Apparatus and Reagents. The apparatus was made from quartz tube (22 mm (internal diameter) x 350 mm). The tube was provided with ground glass type joints at either end. The entrance is closed with a quartz stopper. The second joint connects to a spiral condenser. The length of the condenser spiral is 200 mm (8 mm dia.). The stream required is brought from a boiling flask which is provided with three necks, these serve for the addition of water, steam outlet and for the immersion heater. The passage of steam is served by a quartz tube opening into the reaction tube close to the quartz stopper. The connection is heated by an electric furnace (125 mm long). (A figure is given).

Pure preparations of TiO_2 , SO_2 and U_3O_8 were repeatedly melted and dried in the furnace at 100°C and finely ground. A mixture was made of SiO_2 and TiO_2 (1:1).

A similar mixture was prepared from SiO_2 and U_3O_8 . General conditions of decomposition. In furnaces of small dimensions heat losses occur when steam is passed through. 5 ml condensate per min. reduces the temperature 100°C as a result the temperature and rate of flow should be assured. Small furnaces wound with certain metal alloys allow a maximum heat of 1150°C at a steam velocity of 5 ml steam condensate. If the life of the furnace is not to be shortened. The dependence of speed of degradation on temperature, at constant steam supply on different steam vapour speeds at constant temperature and finally the influence of different activators at constant temperature and speed of steam, were found. In the main the method used was as follows:

Card 1/5 Card 2/5

The sample (100 mg) was always thoroughly mixed with activator in a quartz boat and then thoroughly decomposed. During decomposition the condensate was collected in 10 - 10 - 25 - 50 - 50 ml portions. Each portion was separately titrated and the degree of decomposition calculated from the amount of titrant required. Plotting this value against volume of condensate and time respectively gave the decomposition curves. The volume (and times) and temperature for optimum conditions can be derived from these curves. Decomposition of aluminum fluoride. SiO_2 alone can be used as an activator instead of an SiO_2 and TiO_2 mixture. The finely ground sample (about 0.1000g) is weighed into a porcelain basin of about 6 cm dia. and to this is added the same volume of finely ground quartz. After thorough mixing with a fused glass rod and the mixture transferred quantitatively to a quartz boat, the dish is "washed out" with a small quantity of activator and the mixture in the boat is covered over with a complete layer of SiO_2 . The rate of passage of vapour is set at 5 ml condensate/min., the hot furnace (at about

Rev 1/c

CZ/8/52(82)/10-38/39
All-quartz Apparatus for the Determination of Fluorine by Means
of Pyrohydrolysis

1000°C) being moved to the condenser side and the boat with the sample being moved to such a position that, after the movement of the furnace, the centre of the boat was about 3/4 in. in the furnace. The tube is closed with a quartz stopper; the furnace is moved on the mouth of the reaction tube and the condensate (100-150 ml) caught in a prepared beaker. The condensate is titrated with O.I.-NaOH, using Phenolphthalein as an indicator, firstly in the cold and then after heating the solution to boiling.

Decomposition of cryolite. The decomposition of cryolite was found to have a marked temperature dependence, but the maximum was attained at 900°C. At higher temperatures the decomposition rate declines again. It is the obvious result of the fact that at temperatures higher than 900°C the mixture fuses so that the hydrolytic reaction is retarded. The choice of the correct temperature is obtained from the curve given.

Card 4/5
For the determination of F in KF₂, the authors recommend the same method as for AlF₃, except that the temperature of the furnace should be 900°C and the activator a mixture of SiO₂ and U₃O₈ (SiO₂ alone gives a slower fluorine release).

Decomposition of refractory concentrates. The decomposition of CaF₂ occurs quickly and quantitatively under the conditions given for AlF₃, but the presence of BaSO₄,

in the concentrates (not CaSO₄) can interfere if present.

As a result, the method can only be used for process control. The method used is the same as for AlF₃, but the temperature of the furnace is 1150°C.

86. Production of Cadmium and Rare Metals in Kazakhstan Proposed

"Unused Supplies ('Reserves') of the Nonferrous Metallurgy of Kazakhstan," by Yu. Svyadosh, secretary of the East Kazakhstan Oblast Committee, Communist Party of Kazakhstan, Ust'Kamenogorsk, Promyshlennno-Ekonomicheskaya Gazeta, No 54 (198), 5 May 57, p 2

"The importance of the complete utilization of raw material is being underestimated. The new zinc and lead plants at Ust'-Kamenogorsk are a typical example of this. The very nature of Altay ores imposed the requirement that in designing these enterprises provisions should have been made for the many-sided utilization of raw material. Then lead, zinc, copper, cadmium, antimony, selenium, tellurium, sulfur, and rare metals

could have been extracted from the lead and zinc concentrates. Both principal types of production, that of lead and that of zinc, would then have been organically interconnected: after the Waelz-process the lead-iron wastes of the zinc production should be treated in the lead smelting stage, while the dust containing zinc, cadmium, and rare metals, which is obtained in the lead production, should be returned to the processing stage in which zinc, cadmium, and rare metals are produced. If this procedure were adopted it would have been possible to extract more lead and zinc than at the old plants." (U)

ABSTRACT: The effect of the configuration of a measuring chamber with the capacitor microphone of the gas analyzer developed at the State Union Design Office of Instruments for Gas Analysis (Gosudarstvennoye soyuznoye konstruktorskoye byuro priborov gazovogo analiza) on the sensitivity of the microphone is analyzed. It is shown that the frequency characteristics of the acoustic units of gas analyzers can be varied by various configurations of the measuring chamber in conjunction with the parameters of the microphone. This makes possible a wider selection of the working frequencies of gas analyzers in determining the optimal total effect, ensuring the required value of the voltage developed by the microphone. 5 illustrations. TITLE: Method of determining the magnetic fields of spreading currents (Letter to the editor)

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 33, no. 5, 1963, 636-638

TOPIC TAGS: induced magnetic fields, leadage currents

ABSTRACT: In solving certain electrodynamic problems it is necessary to calculate the magnetic field induced by the so-called spreading current, that is, the current draining off electrodes immersed in a conducting medium. The usual approach is by solution of the set of vector equations - $\text{rot } \mathbf{H} = \mathbf{J}$ and $\text{div } \mathbf{H} = 0$ - for appropriate boundary conditions. In view of the mathematical difficulties often involved, the author proposes expressions for the magnetic field components along the axes of spherical coordinates in the form of series with constant coefficients equal to the coefficients of an expansion in spherical functions of the spreading current potential. The vector equations for the

Card 1/2

L 9925-63
ACCESSION NR: AP3000022

stationary current field in terms of the electric field intensity in the medium, the conductivity of the medium and the current field potential are deduced. A harmonic equation for the potential, on the assumption that the medium is uniform, is given. Finally, equations are written for the magnetic field components along the spherical coordinate axes. Two illustrative examples are presented. Orig. art. has: 15 sets of equations.

TITLE: Calculation of low frequency electromagnetic fields in coordinates in which Laplace's equation separates

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 12, 1965, 2160-2166

TOPIC TAGS: mathematic method, boundary value problem, electrodynamics, adiabatic approximation, Laplace equation, variable-separation, electromagnetic field

ABSTRACT: The authors present a technique for solving certain boundary value problems involving two vectors F and Q which satisfy the differential equations $\text{curl } F = Q$ and $\text{div } F = \text{curl } Q = \text{div } Q = 0$. Such problems arise in the quasistationary approximation to electrodynamics. The vector Q is expressed as the gradient of a scalar V which satisfies Laplace's equation. Laplace's equation is solved by separation of variables and V is expressed as an integral (or a sum) over the separation parameters of the product of an arbitrary function of the separation parameters by the corresponding solution of Laplace's equation. An expression is given for the corresponding value of F as a similar integral (or sum) involving the same arbitrary function of the separation parameters, derivatives of the corresponding solutions of Laplace's

Card 1/2

L 3077-65

ACC NR: AP6002438

equation, and certain functions of the coordinates, which depend on the coordinate system employed to separate the variables in Laplace's equation. These functions are listed for 11 different coordinate systems in which Laplace's equation separates. The relation between the boundary conditions on F , Q , and V is discussed. Not all possible boundary conditions can be treated by the present technique; only solutions in which F is everywhere perpendicular to Q can be obtained. This technique has been previously employed by the authors (ZhTF, 33, No. 5, 636, 1963) to calculate magnetic fields of distributed currents. The authors thank G.A. Grinberg, corresponding member of the AN SSSR, for discussing the work. Orig. art. has: 59 formulas.

TOPIC TAGS: cadmium production, metal diffusion resistance, centrifugal reactor separator, zinc potential, cadmium potential

ABSTRACT: Under certain conditions, a process based on a decrease in diffusion resistance, particularly on the difference between the normal potentials of zinc and cadmium, can result in a 100 times more rapid reaction for the isolation of metallic cadmium from a solution of zinc and cadmium sulfates, compared to the usual manufacturing process. The new process was developed for the direct production of metallic cadmium from the sulfate solution in centrifugal reactor-separators with continuous separation and discharge of the reaction products; this permits reactions with stoichiometric ratios of the starting materials. The rapidity of the process and low reaction volume made possible the creation of compact automatic equipment controlled by the process of cadmium cementation;

ACCESSION NR: AP4049077

an automatic polarograph serves as the initial regulating impulse. Essentially, the process consists of the following: the copper-cadmium cake obtained as a result of separation of the zinc electrolyte is dissolved in spent zinc acid electrolyte and the copper is removed by the addition of a small amount of zinc powder; the solution then moves into the centrifugal reactor-separator where more zinc powder is added. Cadmium cementation, microgranulation, etc. is carried out there. The pulverized cadmium so obtained is 99.5% pure, instead of the earlier 40%; only 1/3 of the formerly used zinc and about 7% of the electrical energy are required, and 95% instead of 90% pure cadmium is obtained from the copper-cadmium cake. The process has been used for 2 years and has proven highly satisfactory under industrial conditions. It may also be used for producing nickel, copper, thallium, etc.

TITLE: Adequacy measurement of the human olfactory analyzer

SOURCE: Biofizika, v. 10, no. 6, 1965, 1093-1098

TOPIC TAGS: olfaction, man, electrophysiology, vision, gustation

ABSTRACT: The response of the olfactory analyzer to adequate stimulation (an odoriferous gas) follows the same pattern as that observed with the other analyzers. The relationship $m/t = f(t)$ is a "force-duration" curve characteristic of the olfactory analyzer.

There are stimuli with the parameters $Q = 40 \pm 60 \text{ cm}^3/\text{sec}$, $C = (0.407 \pm 0.590) \cdot 10^{-6} \text{ g/cm}^3$ for ethyl alcohol and $Q = 30 \pm 60 \text{ cm}^3/\text{sec}$, $C = (0.09 \pm 0.14) \cdot 10^{-9} \text{ g/cm}^3$ for the fumes of isoamyl alcohol to which the receptor responds maximally. This confirms the theory of adequacy measurement developed by Makarov that the excitability of any physiological system is a complex function of the parameters of the relevant stimulus. The presence of adequate stimuli for the various human analyzers - visual, acoustic, tactile, gustatory - was demonstrated by Makarov on the basis of many electrophysiological and neurodynamic investigations. The presence of adequate stimuli has now been demonstrated for the olfactory analyzer as well. Orig. art. has:

EXCERPTA MEDICA Sec. 17 Vol. 3/9 Public Health Sept. 57

2636. SVYATIKHIN V. M., Moscow. *Duties of medical science in the 6th five-year plan (Russian text) SOVETSK. ZDRAVOOKH. 1956, 3(3-7) Soviet hygienists have concentrated on working out the following problems: (a) The hygiene of new growing towns and inhabited places, particularly the newly established agricultural areas, the East and the North. (b) The hygiene of the work and prevention of occupational diseases in connection with wide application of electric power in agriculture and industry, and complex mechanization and automatization of industrial processes, as well as the use of atomic energy. In this connection it is extremely important to study: (1) general rules governing the physiologic state of exhaustion and other changes in the organism developing under the influence of various kinds of work; (2) physiologic basis for training and retraining of workers in various occupations; (3) limiting concentrations of harmful substances occurring in industrial chemical processes; (4) effective anti-dust measures for underground workers in mining industry. Particular attention should be paid to workers and employees dealing with radioactive substances, as well as to the decontamination of wastes containing radioactive substances. The next hygienic problem of the plan is related to the study of the physiologic basis of the rational nutrition of the healthy and the sick man. Here physiologic standard of nutrition should be worked out for: (a) the inhabitants of various geographic and climatic regions of USSR; (b) the industrial workers occupied in establishments of atomic energy; (c) the pupils and other age groups of the population. A large place in the plan is occupied by the problem regarding treatment and prevention of more widely spread diseases.

Preliminary crystallization of green syrup before boiling to second product. A. S. Svyatishenko and Y. V. Grinfel'd (*Sekker. Prom.*, 1952, No. 3, 40; *Sug. Izd. Akad.*, 1952, 14, 86).—When working with high-purity masscuitas, the green syrup returned to second product had a purity of 85—86%. To reduce this, the green syrup was further crystallized in mixers to give a 42—43% crop of crystals and to bring the syrup purity to ~78%. After centrifuging, this syrup was returned to second boiling.
