Title: On the Problem of Physical and Biological Dosage of Ultrasonic Waves

Original
Periodical: Ceskosl. biol., 1956, 5, No 3, 153-162; Czech; Russian and German resumes

Abstract: Analysis of a new calorimetric method of measuring absorption of ultrasonic waves in liquid. The heat exchange with the surrounding medium, occurring when cooling the liquid, takes place without losses after disconnecting the apparatus. Measurements have shown, that thanks to high losses, only 5% of the energy of the ultrasound acts on the biological medium. When irradiating spores *Rhizopus nigricans*, it was observed that the reduction in germination was an exponential function of the time of action of the

Abstract: ultrasonic waves and a linear function of its intensity. The germination of the spores is independent of their concentration. The ultrasonic waves do not produce a morphological change in the spores. However, one observes certain specific action of the ultrasonics, which cannot be attributed to the increased temperature due to irradiation.

Title : A Rare Localization of Lymphogranulomatosis (Trachea,
Bronchi and Lung)

Orig Pub : Probl. gematol. i perelivaniya krovi, 1957, 2, No 5, 61-
63

Abstract : A case of lymphogranulomatosis with involvement of the
lungs, bronchii and trachea in a 34-year-old patients is
described. During the patient's life a disparity bet-
ween the scant physical and pronounced roentgenological
changes (extensive focal lesions of the pulmonary tis-
sue and of the lymphatic nodes, the presence of gross
indurations and emphysema) in the lungs and the presence
of fistulas of the cervical lymph nodes with purulent

secretion was noted. Morphological investigation confirmed the presence of an exudative form of lymphogranulomatosis of the lungs; along with proliferation of a polymorphocellular connective tissue in the lungs characteristic for granulomatosis, there existed a picture of interstitial pneumonia, and a fibrinous and serous exudate in the alveoli with manifestations of its organization. The cellular composition of the exudates in the alveoli and in the interstitial tissue of the septa in various fields of vision was comparable to that in areas of tissue infiltrates. -- M.Ya. Khodas

AUTHOR: Tarkhanyan, R. G.

ORG: TsNI Physicotechnical Laboratory AN ArmSSR (TsNI fiziko-tekhnicheskaya laboratoriya AN ArmSSR)

TITLE: Thermoelectromotive force in semiconductors in a strong magnetic field

SOURCE: AN ArmSSR. Izvestiya. Fizika, v. 1, no. 2, 1966, 66-74

TOPIC TAGS: strong magnetic field, thermoelectromotive force, semiconductor theory

ABSTRACT: The Onsager relationships are used to show that the expression

for differential thermoelectromotive force where s is entropy reduced to a single electron and e is electronic charge is true for arbitrary dispersion of the energy of electrons in the conduction band. Explicit expressions are given for the thermoelectromotive force in a quantizing magnetic field in the case of a nonparabolic zone of the n -InSb type for arbitrary degeneration of the electron gas. In conclusion I am deeply grateful to A. I. Ansel'm and Yu. N. Obraztsov for examination of the manuscript and valuable remarks. Orig. art. has: 45 formulas.

"X-Ray Physical Peculiarities of the Fluorescent Screen."

Budapest, Magyar Radiologia, Vol 18, No 3, Jun 66, pp 169-174

Abstract [authors' Russian, English and German summaries, modified]: The phenomenon of luminescence and the physical factors affecting it are described. The light intensity of the screen depends on its material, on the thickness of its layer, on the granulation of the luminescent substance and on its physical properties. Cadmium-wolframate is recommended to prevent after luminescence of the screen. Five Soviet-bloc and 6 Western references.

"Fluoroscopy and the Factors Influencing the Quality of the Fluoroscopic Image."

Budapest, Magyar Radiologia, Vol XVIII, No 4, Jul 66, pages 231-235.

Abstract: In the present article, factors not involving the screen, the electronic parameters used in fluoroscopy and the body examined are discussed. The most important physical, geometrical and technical information related to fluoroscopy is described. In conclusion, it is stressed that not only good apparatus is described but its correct running and the best choice among the possibilities is also necessary for the achievement of good pictures. 5 Eastern European, 4 Western references.

TITLE: A measurement probe. Class 21, No. 190956

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1967, 43

TOPIC TAGS: electronic measurement, electric measuring instrument

ABSTRACT: This Author's Certificate introduces a measurement probe made in the form of a spring-loaded needle feeler equipped with a feed mechanism for putting the feeler in contact with the element to be measured, e. g. solid circuit contact areas. To improve accuracy in locating the feeler, the feed mechanism is equipped with a holder which is connected by flat springs to a bar suspended on a diaphragm, and simultaneously coupled through a flexible cable to a spring-loaded rod resting against a slider which controls longitudinal motion of the feeler.

TITLE: Firing Open-Hearth Furnace With Natural Gas

PERIODICAL: Metallurg, 1959, . . . Nr 10, pp 14-16 (USSR)

ABSTRACT: The Seven Year Plan provides for an increased production of gas. In this connection a method of firing open-hearth furnaces with cold natural self-carburating gas was developed under the supervision of Academician Dobrokhotoy, N. N. Before furnace combustion, gas is preheated by the heat (1) generated during gas combustion in the port, and (2) accumulated by the lining of the port. In the foundry shop of the Plant imeni Karl Liebknecht (zavod imeni K. Libkhekhta) an open-hearth furnace was redesigned accordingly (see Fig. 2). Gas introduced through a vertical flue by

Card 1/3

low-pressure burner, yields a luminous flame which equals that produced by natural gas with 30 to 40% mazut addition. Research is being continued to simplify the design of furnace ports for natural self-carburating gas and eliminate water-cooled flues. There are 2 figures and 2 tables.

"Vest Inzher i Tekh" No 3

The author discusses some of the highlights of the modernization of one of the machines. At the end of his article he gives the operating data for the modernized machine: Seven speed spindles from 116 to 602 rpm, speed at no-load operation, 350 mm per sec, the power drive for the spindle motor, 40 hp.

Neutron crystal spectrometer of the Institute Atomic Physics Bucharest. D. Bally, E. Tarina, S. Todireanu, and I. Olteanu. Acad. rep. populare Romane, Inst. fis. at. IFA/BN/20, 9 pp.(1959)(in English).—The instrument employs either a plane or bent crystal. In the former modification the resolving power is 0.53 μ sec./m. with a cleavage plane of calcite. In the bent-crystal modification the resolving power is 1.23 μ sec./m. for the (1010) planes of quartz. The min. Bragg angle that can be clearly observed with the plane crystal corresponds to 5.5 e.v.; with the (1340) planes of quartz this is extended to 38 e.v.

1589. SO-CALLED 'METACHROMATIC' LEUCODYSTROPHY - Az ú.n. 'metachromasiás' leukodystrophiáról - Tariska I. - IDEGGYOG.SZLE 1958. 11/1-2 (41-50) Tables 1 illus. 15

Highly similar clinical pictures which developed in 2 siblings at the time of puberty are discussed, together with the morbid-anatomical findings in the elder brother. The disease of the siblings was characterized by juvenile personality changes, slow mental regression, ataxia, pyramidal and extra-pyramidal motor disturbances, incontinence and uncontrollable fits of laughing. The most characteristic pathological-anatomical findings in the elder brother were a widespread, non-systematic demyelination in the telencephalon, with massive accumulations of metachromatic breakdown products containing lipid, carbohydrate and protein components. The degree of demyelination decreased caudally. The metachromatic breakdown products extended beyond the demyelinated areas to the roots of the spinal cord, i. e. to their non-glial parts. Glial and Schwann cell insufficiency is considered to be a selective and relative process, not concerned with removal of the secondary and retrograde degeneration products by the glia, or with their liability to sclerosis, since the metachromatic breakdown is a consequence of a disturbance of synthesis. The metachromatic substance found in the renal tubules is interpreted as a transport substance.

Title: On the Problem of Physical and Biological Dosage of Ultrasonic Waves

Original
Periodical: Ceskosl. biol., 1956, 5, No 3, 153-162; Czech; Russian and German resumes

Abstract: Analysis of a new calorimetric method of measuring absorption of ultrasonic waves in liquid. The heat exchange with the surrounding medium, occurring when cooling the liquid, takes place without losses after disconnecting the apparatus. Measurements have shown, that thanks to high losses, only 5% of the energy of the ultrasound acts on the biological medium. When irradiating spores *Rhizopus nigricans*, it was observed that the reduction in germination was an exponential function of the time of action of the

Abstract: ultrasonic waves and a linear function of its intensity. The germination of the spores is independent of their concentration. The ultrasonic waves do not produce a morphological change in the spores. However, one observes certain specific action of the ultrasonics, which cannot be attributed to the increased temperature due to irradiation.

secretion was noted. Morphological investigation confirmed the presence of an exudative form of lymphogranulomatosis of the lungs; along with proliferation of a polymorphocellular connective tissue in the lungs characteristic for granulomatosis, there existed a picture of interstitial pneumonia, and a fibrinous and serous exudate in the alveoli with manifestations of its organization. The cellular composition of the exudates in the alveoli and in the interstitial tissue of the septa in various fields of vision was comparable to that in areas of tissue infiltrates. -- M.Ya. Khodas

TITLE: Thermoelectromotive force in semiconductors in a strong magnetic field

SOURCE: AN ArmSSR. Izvestiya. Fizika, v. 1, no. 2, 1966, 66-74

TOPIC TAGS: strong magnetic field, thermoelectromotive force, semiconductor theory

ABSTRACT: The Onsager relationships are used to show that the expression

for differential thermoelectromotive force where s is entropy reduced to a single electron and e is electronic charge is true for arbitrary dispersion of the energy of electrons in the conduction band. Explicit expressions are given for the thermoelectromotive force in a quantizing magnetic field in the case of a nonparabolic zone of the n -InSb type for arbitrary degeneration of the electron gas. In conclusion I am deeply grateful to A. I. Ansel'm and Yu. N. Obraztsov for examination of the manuscript and valuable remarks. Orig. art. has: 45 formulas.

"X-Ray Physical Peculiarities of the Fluorescent Screen."

Budapest, Magyar Radiologia, Vol 18, No 3, Jun 66, pp 169-174

Abstract [authors' Russian, English and German summaries, modified]: The phenomenon of luminescence and the physical factors affecting it are described. The light intensity of the screen depends on its material, on the thickness of its layer, on the granulation of the luminescent substance and on its physical properties. Cadmium-wolframate is recommended to prevent after luminescence of the screen. Five Soviet-bloc and 6 Western references.

"Fluoroscopy and the Factors Influencing the Quality of the Fluoroscopic Image."

Budapest, Magyar Radiologia, Vol XVIII, No 4, Jul 66, pages 231-235.

Abstract: In the present article, factors not involving the screen, the electronic parameters used in fluoroscopy and the body examined are discussed. The most important physical, geometrical and technical information related to fluoroscopy is described. In conclusion, it is stressed that not only good apparatus is described but its correct running and the best choice among the possibilities is also necessary for the achievement of good pictures. 5 Eastern European, 4 Western references.

TITLE: A measurement probe. Class 21, No. 190956

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1967, 43

TOPIC TAGS: electronic measurement, electric measuring instrument

ABSTRACT: This Author's Certificate introduces a measurement probe made in the form of a spring-loaded needle feeler equipped with a feed mechanism for putting the feeler in contact with the element to be measured, e. g. solid circuit contact areas. To improve accuracy in locating the feeler, the feed mechanism is equipped with a holder which is connected by flat springs to a bar suspended on a diaphragm, and simultaneously coupled through a flexible cable to a spring-loaded rod resting against a slider which controls longitudinal motion of the feeler.

TITLE: Firing Open-Hearth Furnace With Natural Gas

PERIODICAL: Metallurg, 1959, . . . Nr 10, pp 14-16 (USSR)

ABSTRACT: The Seven Year Plan provides for an increased production of gas. In this connection a method of firing open-hearth furnaces with cold natural self-carburating gas was developed under the supervision of Academician Dobrokhotoy, N. N. Before furnace combustion, gas is preheated by the heat (1) generated during gas combustion in the port, and (2) accumulated by the lining of the port. In the foundry shop of the Plant imeni Karl Liebknecht (zavod imeni K. Libkhekhta) an open-hearth furnace was redesigned accordingly (see Fig. 2). Gas introduced through a vertical flue by

Card 1/3

Firing Open-Hearth Furnace With Natural Gas

SOV/130-59-10-8/20

low-pressure burner, yields a luminous flame which equals that produced by natural gas with 30 to 40% mazut addition. Research is being continued to simplify the design of furnace ports for natural self-carburating gas and eliminate water-cooled flues. There are 2 figures and 2 tables.

1589. SO-CALLED 'METACHROMATIC' LEUCODYSTROPHY - Az ú.n. 'metachromasiás' leukodystrophiáról - Tariska I. - IDEGGYOG.SZLE 1958. 11/1-2 (41-50) Tables 1 illus. 15

Highly similar clinical pictures which developed in 2 siblings at the time of puberty are discussed, together with the morbid-anatomical findings in the elder brother. The disease of the siblings was characterized by juvenile personality changes, slow mental regression, ataxia, pyramidal and extra-pyramidal motor disturbances, incontinence and uncontrollable fits of laughing. The most characteristic pathological-anatomical findings in the elder brother were a widespread, non-systematic demyelination in the telencephalon, with massive accumulations of metachromatic breakdown products containing lipid, carbohydrate and protein components. The degree of demyelination decreased caudally. The metachromatic breakdown products extended beyond the demyelinated areas to the roots of the spinal cord, i. e. to their non-glial parts. Glial and Schwann cell insufficiency is considered to be a selective and relative process, not concerned with removal of the secondary and retrograde degeneration products by the glia, or with their liability to sclerosis, since the metachromatic breakdown is a consequence of a disturbance of synthesis. The metachromatic substance found in the renal tubules is interpreted as a transport substance.
