TITLE: A device for mass EKG examination of the population. Class 30, No. 188621

SOURCE: Izobreteniya, promyshlennye obraztsy, tovarnyye znaki, no. 22, 1966, 78-79

TOPIC TAGS: electrocardiography, heart rate, cardiovascular system

ABSTRACT: An Author Certificate has been issued for a device which contains electrodes, biopotential amplifiers, and power sources, and which has units for analyzing the temporary and amplitude relationships of EKG elements, a readout unit, and an automatic electromechanical lead commutator (see Fig. 1). It is designed for the

automatic evaluation of EKG elements and for signal indication of deviations from selected EKG elements of examined EKG's with respect to normal EKG's. A model for analysis of the temporary relationships of EKG elements contains systems for identification of examined EKG intervals, comparison of the examined intervals with selected normal intervals, and signal indication during deviations of the values to be compared which exceed established values. A model for analysis of amplitude relationships of EKG elements includes systems for identification and amplitude comparison (with normal waves) of examined EKG waves, and systems for signal indication during deviations of the values to be compared which exceed established values. A model for signal indication of a deviation of the examined EKG elements from the established values and for reduction of the probability of an incorrect result consists of systems of coincidence, systems with different storage capacity, and a signal indicator. A device for automatic commutation of leads and establishment of a certain number of examined EKG cycles on each lead has systems for output of synchronized pulses, a counter of synchronized pulses, and a pitch selector. TITLE: Synthesis of a light signal receiver during the heterodyning of light

SOURCE: Problemy peredachi informatsii, v. 1, no. 3, 1965, 56-70

TOPIC TAGS: signal processing, light emission, coherent signal, laser application

ABSTRACT: The development of laser technology opens up opportunities for the utilization of coherent light signals for communications and for the location of various objects. The present problem is the optimization of the methods of receiving such signals. The author calculates the statistical voltage characteristics at the output of a photomixer during the heterodyning of fluctuating light signals. In addition to the useful signal and, possibly, the background, the mixer is affected by a sufficiently powerful heterodyne signal; a circuit (filter) serves as a load and it is tuned to the intermediate frequency (between the input and the heterodyne signals). The author finds the optimal method for processing the voltage at the output of the photomixer in the receiver. The method makes it possible to obtain the best characteristics for the detection of weak light signals and to measure the parameters coded in them. An evaluation is made of the potential possibilities of light signal receivers in detection and measurement. Orig. art. has: 73 formulas and 3 figures.

TITLE: Generalization of the theory of the carrier line to
the case of a sagittate wing

PERIODICAL: Referativnyy zhurnal. Mekhanika, no. 5, 1962, 28,
abstract 5B139 (Visnyk Kyyiv's'k. un-tu, 1960 (1961))
no. 3, ser. matem. ta mekhan. no. 1, 44 - 54)

TEXT: An attempt is made to generalize the theory of the carrier
line to a sagittate wing by means of the distribution of the con-
nected vortices of the wing on the carrier vortex line and the sys-
tem of complementary connected vortices perpendicular to the axis
of the wing, which permits infinitely great values of the induced
velocity close to the carrier vortex. A method is given for calcula-
ting the vortex system of the wing, based on the combination of
the general vortex theory of a wing of finite span with the theory
of a thin profile, and also a method of calculating the complemen-
tary aerodynamic forces which arise as a result of the interaction of
the complementary connected vortices and the transverse component

AUTHOR: Tartakovskiy, P. P.; Putyata, V. I.

TITLE: Some aerodynamic problems of a swept wing

CITED SOURCE: Tr. Kuybyshevsk. aviat. in-t. vy-p. 15, ch. 1, 1962, 3-22

TOPIC TAGS: aerodynamics, swept wing, slip, flow, cross-section lifting line theory

TRANSLATION: After a thorough analysis of the hypothesis of the plane cross section applied to a wing, streamlined with slip, the authors establish the necessity of introducing the supplementary assumptions and constructing a vortex system which takes account of the effect of the induced velocities directed along the axis of the wing; it is shown that the additional pressure arising at the wing with the slip, has a considerable value. Using the methods of the theory of thin profile wings, and the theory of lifting lines, and using certain solutions, obtained by these methods, the authors distribute the velocity along the surface of the wing. Calculation of the force arising on the swept-back wing is given;

Card 1/2

L 18766-63

ACCESSION NR: AR3006434

estimates are made of the effect of the curvature of the section. The question of the limits of applicability of the theory of lifting lines to the calculation of sweptback wings is considered. It is shown that the complete pressure drop is formed from the pressure drops determined on the basis of the theory of plane cross sections, and the fall of pressure caused by the flow directed along the axis of the wing; in some cases this term is compared with the first (fundamental). At the end of the work, a method is given for determining the distribution of the circulation along the wingspan of the swept wing. Bibl. 5 names. A. I. Borisenko

Photo-electric conduction in rock-salt crystals under ultra-violet illumination. P. TARTA-KOVSKY and V. POLOVINER (Physikal. K. Sovjetunion, 1930, 9, 407-413); cf. A., 1930, 157.—The depolarization current has been investigated of in NaCl crystal containing U centres and polarized by illumination by an Al spark. After the depolarization current in ultra-violet light has fallen to a small val. a large current is again observed on illumination with visible light. The depolarization current with visible light shows max. at 4500 and 4750 Å. It is deduced that the electrons forming the space charge are bound in two levels; the higher of which coincides with the I' level.

Tartakovskii, V. A. Explicit formulas for the solution of systems of ordinary differential equations. Ukrain. Mat. Zurnal 3, 128-160 (1951). (Russian)
In two earlier notes [Doklady Akad. Nauk SSSR (N.S.) 72, 633-636, 853-856 (1950); these Rev. 12, 27, 180] the author announced and slightly elaborated his new approach to the solution of the n -dimensional analytical system $\dot{x} = f(x)$ by infinite vectors and matrices. In this paper this work is elaborated at length. In particular, the Cauchy existence theorem is dispensed with and is obtained by means of direct estimates. [Additional reference: Lappo-Danilevskii, Theory of functions of matrices . . . GTII, Moscow, 1934.] S. Lesschets (Princeton, N. J.).

"Matemat Sbor" Vol 32 (74), No 1, pp 225-248

N. V. Yefimov (ibid. 1939-1946; Uspekhi Matemat Nauk, Vol III, No 2 (24) (1948)) studied the flexibility and inflexibility "in the small" of a part of an analytical surface around its point of depression. In this article the author establishes a related theorem concerning the set of all points of the space of coeffs of n th-degree forms which represent special forms. Submitted 9 May 52.

TITLE: On the Operating Precision of Flexible-belt Transmissions (O
tochnosti peredach uprugoy lentoj)

PERIODICAL: Teoriya i raschet elementov priborov tochnoy mekhaniki.
Moscow-Leningrad, Mashgiz, 1957, pp 19-38

ABSTRACT: Examination is made of the transmission of a rotational motion by a nonstretchable belt via pulleys of radius R between two parallel shafts. A theoretical analysis is made of the effect of the elasticity (during flexure of the belt) on the variation in the angle of lag δ (between the driven shaft and the drive shaft) as a result of increasing the tensile force P in the belt in proportion to the increase of the resistance on the driven shaft. The approximate formula

$$\delta = \frac{\sqrt{(EI)^3}}{6R^3} \left(\frac{1}{\sqrt{P_2^3}} - \frac{1}{\sqrt{P_1^3}} \right)$$
