TITLE: Solution of the static plane problem of the theory of elasticity for heterogeneous isotropic bodies with the help of the theory of complex functions

SOURCE: Prikladnaya matematika i mekhanika, v. 30, no. 2, 1966, 379-387

TOPIC TAGS: elasticity theory, motion mechanics, *complex function*

ABSTRACT: A method is presented for solving the plane static problem of the theory of elasticity for heterogeneous bodies, by successive approximations based on transformations of the type proposed by N. I. Muskhelishvili (Nekotoryye osnovnyye zadachi matematicheskoy teorii uprugosti. Izd. 4-o. M., Izd-vo AN SSSR, 1954) and on conformal transformations. After presenting the equations of quasi-static equilibrium, geometric relationships, and visco-elastic equations in the form

$$\sigma_{ij,j} + X_i = 0, \quad \epsilon_{ij} = 1/2(u_{i,j} + u_{j,i}), \quad \epsilon_{ij} = \epsilon_{ij} \cdot dG_i, \quad \sigma_{kk} = (\epsilon_{kk} - 3\alpha T) \cdot dG_k$$

$$\epsilon_{ij} = \sigma_{ij} - 1/\nu \sigma_{kk} \delta_{ij}, \quad \epsilon_{ij} = \epsilon_{ij} - 1/\nu \epsilon_{kk} \delta_{ij}$$

the two basic boundary problems are formulated in the form

$$\frac{\partial^2 G}{\partial z^2 \partial \bar{z}} + \operatorname{Re} \left(2A_1 \frac{\partial^2 G}{\partial z \partial \bar{z}} + 2A_2 \frac{\partial G}{\partial z} + A_3 \frac{\partial G}{\partial \bar{z}} \right) = 2f(z, \bar{z})$$

Card 1/2

L 37077-66.

ACC NR: AP6012557

and

$$\frac{\partial}{\partial \bar{x}} \left[\frac{\mu}{\kappa-1} \left(\frac{\partial U}{\partial \bar{x}} + \frac{\partial \bar{U}}{\partial \bar{x}} \right) \right] + \frac{\partial}{\partial \bar{x}} \left(\mu \frac{\partial U}{\partial \bar{x}} \right) = P(x, \bar{x}), \quad P(x, \bar{x}) = \frac{1}{2} \frac{\partial}{\partial \bar{x}} (\kappa T) - \frac{1}{4} (X+Y)$$

with boundary conditions

$$G(s) = \int_0^s (\sigma_{xx} + i\sigma_{xy}) dz + \int_0^s \overline{M(\bar{s})} \overline{V(\bar{s})} d\bar{s} + c = H(s) \quad (s = \text{const})$$

and $U(s) = u(s) + iv(s)$, respectively. Conformal transformation and the method of successive approximations in solving these equations are discussed. The procedure is demonstrated for a circular body uniformly loaded in the radial direction. Orig. art. has: 2 figures, 59 formulas, and 1 table.

Abstract: The authors attempted to identify the strains isolated from amicrobic urethrites by means of immunofluorescence, serum neutralization, complement fixation and microagglutination. On the basis of these reactions they classify the strains isolated from the amicrobic urethrites as members of the perarickettsial group, TRIC subgroup.

SOURCE: Revista sanitara militara, v. 61, no. 6, 1965, 909-920

TOPIC TAGS: pathology, bone, radiography, skeletal mechanics

ABSTRACT: The authors aim at an objective functional study of the cervical column, using radiography adapted to the specific anatomical and physiopathological conditions of this segment to check on the static and dynamic vertebral pressures on the intervertebral disks as an extremely important element in vertebral pathology. The technique, interpretation and value of the radiographic examination are discussed in some detail. Orig. art. has: 11 figures. [JPRS]

Title : The Treatment of Schizophrenia with Serpasil

Orig Pub : Srpski arkhiv tselok. lekar., 1957, 85, No 9, 943-954

Abstract : 220 schizophrenic patients were treated with reserpine (R), sometimes in combination with electroshock. R produced a decrease of cessation of hallucinations and, in certain cases, of the autism and negativism. The best results were obtained in catatonia and depressive states. The combination with electroshock increased the effectiveness of the treatment; no complications were noticed. In patients with tuberculosis, R was improving both psychic and somatic conditions especially well. The symptoms of Parkinsonism developed in 33 patients who received only R, but were not observed even once in the combined treatment. These symptoms were remedied by artane without interrupting the treatment.

TITLE: Production of artificial radioactive isotopes

PERIODICAL: Tehnika, no. 5, 1962, 837-842

TEXT: The article deals briefly with the production of radioactive isotopes in nuclear reactors and describes the achievements of the "Boris Kidrič" Institut za nuklearne nauke (Institute of Nuclear Sciences) in Belgrade-Vinča in this field. The production program of this Institute presented to the Conference on Industrial Application of Radioactive Isotopes, held in Bled from June 9 to 11, 1960, has been practically fulfilled. In the Yugoslav reactor the irradiation is carried out in vertical reactor channels. The neutron-gamma, neutron-proton and neutron-alpha reactions are used for producing radioisotopes. In 1961, the Laboratory for High Activity of this Institute made 1,929 radioactive material shipments totaling 218,446 C. The Laboratory accepts orders for the following:

1) Radiographic and other Co^{60} sources of standard dimensions and up to 10 C per sample, and for reactivation of weak radiographic sources of Ir^{192} up to 20 C per sample; 2) various S^{35} and P^{32} preparations with a carrier or carrier-free, as well as J^{131} and Au^{198} preparations; 3) radiochemical radiation sources of alpha, beta and gamma emitters such as Po^{210} , S^{35} , J^{131} , P^{32} and Co^{60} ; and 4) various radioactive isotopes not chemically treated. In 1962, the Laboratory will endeavor to master the production of sterilized preparations for medical purposes containing J^{131} , P^{32} , Au^{198} , S^{35} , Na^{24} , K^{42} radioisotopes. There are 4 tables and 3 figures.

TITLE: Production of radioisotopes and labelled compounds at the Boris Kidric Institute of Nuclear Sciences

SOURCE: Nuklearna energija, no. 2, 1965, 2-9

TOPIC TAGS: radioisotope, chemical labelling, radiation chemistry, chemical research facility, nuclear physics research facility

ABSTRACT: Research associated with the production of radioisotopes was initiated in 1957. In early 1959 the hot chemistry laboratory was set up to cover the production of radioisotopes, and later the production of labeled compounds. For implementation of the program it was essential to have a number of problems solved: training of staff for work with radioisotopes at high activity levels; technology of material irradiation in the reactor; distribution of radioisotopes and labeled compounds; improvement of known and mastery of new methods for production of radioisotopes and sources of radiation requiring chemical treatment of targets; development and mastery of procedures for the production of labeled compounds;

Card 1/3

L 3705-66

development of a method for the chemical, radiochemical, radiometric, and pharmaceutical control of the products obtained; designing, staffing, and equipping the laboratory; and designing and building of the necessary facilities and shielding for work with radioisotopes at distance and behind the shielding. The hot laboratory produces a number of radioisotopes requiring simple treatment after irradiation in the reactor, such as dissolution of irradiated targets, filtration of the solution, etc. These include radioactive solutions with the isotopes: sup 42 K, sup 24 Na, sup 45 Ca, sup 89 Sr, etc. which were obtained from the irradiated carbonates; sup 60 Co, sup 65 Zn, sup 110 Ag obtained by irradiation of pure metals; and sup 32 P with carrier, sup 141 Ce, and sup 59 Fe produced from irradiated oxides. However, the production of radioisotopes for application in medicine and some investigations requiring a pure radioisotope of high specific activity in most cases without carrier, is more complex. Therefore, their production is associated with a number of radiochemical separations. Work was carried out to make possible a permanent synthesis of a number of labeled compounds needed for research. First, work was conducted on the chemical synthesis of sup 14C-labeled compounds, and later syntheses were initiated with sup 35S and sup 32P; now the synthesis is planned of compounds labeled with other radioisotopes such as sup 3 H, halogens, etc. Procedures were developed for the production of eighteen compounds labeled with sup 14 C, six sup 35 S-labeled compounds and five sup 32P- labeled compounds. In addition to the production of radioisotopes and labeled compounds, distribution also had to

Title : Concerning Peculiarities of a Pathological-Anatomical
Picture of the Early Stages of Intestinal Amobiasis.

Orig Pub : Arkhiv Patologii, 1956, 18, No. 7, 106-109

Abstract : The study of the early stages of ambiasis compels one to renounce the supposition that incipient necrosis is the seat of amoebic intrusion. In the early stages, necrosis is absent, although amebae may be found in the interstitial tissue of the mucosa, which, in the surrounding area, is but slightly swollen. Necrosis sets in later as a result of endotoxin elimination of the perishing amebae. -- A. M. Vilkert.

of Trichomonas Vaginalis.

Orig Pub : Tr. Omskogo med. in-ta, 1957, No. 21, 287-292

Abstract : Pure cultures of Trichomonas were cultivated on a modified Johnson-Trassel medium: ascitic fluid and liver infusion 20% each, 2% peptone, 0.15% cysteine hydrochloride, maltose and glucose 0.5% each, 5% Tyrode's solution. With the addition of penicillin and streptomycin, 200 units each per ml. of medium, T. vaginalis does not have hemolyzing or plasmo-coagulating properties, does not form H₂S or indole, decomposes glucose, maltose and starch well, and decomposes lactose and galactose weakly; not one strain of vaginal Tri-

To obtain bacteria-free cultures of *Trichomonas vaginalis* a medium is suggested comprising 20% liver infusion, 20% ascitic fluid, 20% peptone, 0.15% muriatic cysteine, 0.3% maltose, 0.3% glucose, 57% Tyrode solution with the addition of penicillin and streptomycin 200 U. to every ml. of the medium. The medium may be liquid, semiliquid, with 0.1% agar, and solid with 3% agar. Subcultures are effected every 3-4 days. Sixty strains were isolated in pure culture. All strains were devoid of haemolytic and plasma-coagulating properties. They did not produce indole nor hydrogen sulphide; they decomposed glucose, maltose and starch with the formation of acid and gas. Some strains decomposed galactose and lactose, but only feebly. The characteristic 'carbohydrate series' may be used in the de-

A125/A126AUTHOR: Teoreanu, I.

TITLE: On the gas fluidization of a layer of solid particles

PERIODICAL: Revista de Chimie, v. 11, no. 12, 1960, 691 - 694

TEXT: The structure of the fluidized layer has been examined by several researchers. P. J. Backer and P. M. Heertjes (Ref. 2) determined the presence of three zones in the gas fluidized layer. The author of subject article establishes an equation of the gas fluidized layer for moderate gas speeds, by using the basic idea developed in (Ref. 3). He first establishes the equations of the time \tilde{t} , needed by the gas bubbles to pass through the operation zone. Starting then from the idea that in case of gas fluidization the solid particles form "packages", characterized by a fraction of cavities ϵ_p , and that a part of the gas penetrates through the layer in the form of bubbles, he derives the equation of the gas fluidized layer: $(\xi - \epsilon_p) = \frac{1 - \epsilon_p}{\tilde{u}} (W - W_f)$ (8), in which ξ = the fraction of cavities of the operation, ϵ_p = the fraction of cavities in the packages of the particles, \tilde{u} = the speed of the gas bubbles in the operation zone, W = the speed of the gas in the fluidized layer, and W_f = the speed of gases which

Card 1/2

On the gas fluidization...

R/003/60/011/012/001/002
A125/A126

flow through the particle packages. On the basis of this relation, the conditions $\epsilon_p = \epsilon_{min}$, $W_f = W_{min}$ (9) are satisfied. Graphical representations obtained for layers formed by different materials confirm the conclusions expressed by (9). Thus, the particle packages remain non-expanded at an increase of the gas discharge, in relation to the above mentioned speed. An increase of the gas discharge passing through the layer leads to an increase of the non-homogeneity of the layer. At high speeds, the particle packages do expand. The transition moment from one field to the other is characterized by a certain value of the fluidization speed, depending on the diameter of the solid particles and the diameter of the column in which the fluidization is accomplished. The motion speed of gas bubbles in a fluidized layer is closely connected to the viscosity of the layer, the mixture of solids and gas in the layer, and the intensity of the processes in the fluidized layer. The degree of non-homogeneity of the layer can be computed by $\eta = \frac{\epsilon - \epsilon_p}{\epsilon(1 - \epsilon_p)}$ (11) or $\eta = \frac{\epsilon - \epsilon_{min}}{(1 - \epsilon_{min})}$ (11'). Title : On the Changes of the Amount and Acidity of Gastric Juice
in Dogs During Slow Introduction of Some Hypnotics ENSV
Teaduste Akad. toimetised. Biol. seer., Izv. AN EstSSR, Ser.
biol., 1957, 6, No 4, 343-354

Abstract : The changes of gastric secretion following the introduction
of luminal (5-30 mg./kg.), barbaryl (10-60 mg/kg) and
chloral hydrate (200 mg/kg), were studied on 6 dogs with
isolated miniature stomachs, and on one esophagotomized dog.
Hypnotics (H) were introduced subcutaneously or per os, once
a day, during 1-4 weeks. Under the influence of any H
whatever, independently from the mode of its introduction,
the amount of gastric juice increased by 50-100 percent, and
the total acidity and content of free HCl increased up to
100 percent in all dogs. Normalization of the gastric sec-
retion after discontinuation of H occurred during a period

TITLE: Radioactivity and terrestrial heat

SOURCE: Natura. Seria geografie-geologie, no. 5, 1965, 35-40

TOPIC TAGS: radioactivity effect, earth radiation, earth thermodynamics, solar radiation

ABSTRACT: The authors combine arguments from the technical literature of many countries to support their conclusion that radioactivity is a principal source of terrestrial heat. The argument is based on these points: heat from the sun is not felt at depths beyond 20 meters; heat from the interior of the earth (if its origin was as a part detached from the sun) should have been exhausted after about 40 million years, while current estimates of the earth's age are much higher than this; and there exist huge quantities of widely distributed radioactive substances in the interior of the earth. TITLE: The Boundary Conditions of Turbulent Flow Over Rough Surfaces (Granichnyye usloviya turbulentnogo potoka pri obtekanii sherokhovatykh stenok)

PERIODICAL: Tr. Tallinsk. politekhn. in-ta, 1956, Vol A, Nr 78, 28 pp, ill.

ABSTRACT: The author examines certain transformations of the well-known relationships for the motion of the flow within the boundary layer next to a conduit surface of a generally turbulent flow within said conduit, which relationships are based on a formal substitution in the viscosity term of the turbulent viscosity ϵ . A comparison is made of the various empirical formulae for calculating the resistance offered by smooth and rough conduits, and the possibility is examined of deriving the rough-conduit formulae from the smooth-conduit formulae, it being assumed that in the case of a rough conduit, the quantity ϵ , 1) remains constant within the confines of the thin boundary layer next to the conduit surface, and 2) is determined

AUTHOR: Tepaks, L.A.

TITLE: The Hydraulic Resistance During Turbulent Filtration (Gidravli-cheskoye soprotivleniye pri turbulentnoy fil'tratsii)

PERIODICAL: Tr. Tallinsk. politekhn. in-ta, 1956, Vol A, Nr 81, 20 pp, ill

ABSTRACT: Starting from the premise that the "formulation of a law govern-
ing the resistance on purely theoretical grounds presents a
problem that is not likely to be solved", the author tries to work
out a semiempirical expression in criterial form. It is stated
that the results of numerous experiments on filtration may be
expressed in the form of

$$p' R' = A' + \sqrt{B'} \sqrt{p'} R' \tag{1}$$

where

$$p' = \frac{gfi}{w^2}, \quad R' = \frac{wl}{\nu}, \quad \text{and } (?) = \frac{m}{1-m} r,$$

Card 1/2 where l is the hydraulic radius of the pores, m is the porosity.
