AUTHOR GRIGOR'YEV, A.P., TOPORKOVA, E.I., FESENKO, A.I.  
TITLE An Anomalous Decay of Hypernucleus. 56-6-53/56  
(Anomalousnyy razryv giperjona - Russian)  
PERIODICAL Zhurnal Eksperiment. i Teoret. Fiziki 1957, Vol 32, Nr 6,  
p 1589 (USSR)

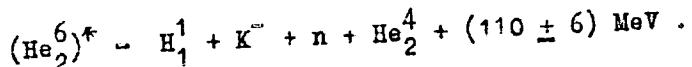

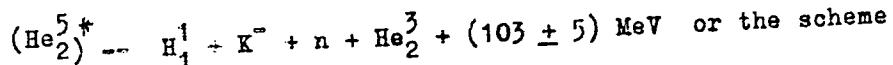

ABSTRACT An uncommon decay of a hyperfragment was discovered in an emulsion chamber (emulsion HIKKI Type "P") which was irradiated by cosmic rays in the stratosphere. A star of the type  $10 + \text{On}$  emits a hyperfragment which, after passing through a course of  $2930 \mu$ , disintegrates during flight into three charged particles. These particles come to a standstill already in the emulsion chamber. A microphotograph is attached and the data on the products of decay are shown in a table. The masses of the products of decay were determined by means of the method density - range (with respect to the pions). The charge and the remaining range of the hyperfragment in the emulsion were determined from the density of the  $\delta$  electrons along the remaining range; they amounted to  $2e$  and  $600 \pm 100 \mu$ , respectively. As the mass of one of the produced particles is equal to  $850 \pm 300$  mass of electrons, it is naturally possible to presume that here

CARD 1/3

## An Anomalous Decay of a Hypernucleus.

56-6-53/56

a K-meson is concerned, As, on the other hand, the charge of the hyperfragment determined with great accuracy, is equal to  $2e$ , the K-meson can be assumed to be negative. (Also the lack of decay products in the case of the K-meson tends to indicate a negative charge of the K-meson). The noncomplanarity of the products of decay of the hyperfragment tends to indicate the flying-off of at least one neutron; its energy is determined from the vector diagram of the momenta. Thus it may be assumed that the hyperfragment decays either according to the scheme

When determining the energy the mass of the K-meson was assumed to be equal to 966,7 electron masses. If it is assumed that the hyperfragment, as a result of the decay of a certain bound hyperon disintegrates, the mass of this hyperon is equal to 3000 electron masses. The estimation of the life of the hyperon gives the amount  $5 \cdot 10^{-11}$  sec. The here discussed case is at present being studied more closely.

TITLE: Methods of studying the frictional properties of polymers  
under conditions of strong one-sided compression

PERIODICAL: Kolloidnyy zhurnal, v. 23, no. 1, 1961, 118-121

TEXT: The authors suggest simple methods of studying the friction of substances in the case of strong unidirectional compression by means of a simple device, which is schematically shown in Fig. 1. It consists of two hand screw-presses upon the same base plate. The first, vertical press serves for producing normal stresses at the contact point of the samples, which was tested for friction. The second press with its axis perpendicular to the first serves for attaining a relative shift of the contacting samples. The possible schemes of testing by means of this device are given in Fig. 2. When using scheme A, the free sample (a plate of that material, whose friction with the polymer is tested) is pressed between two polymer plates 1 and 3 which cannot be moved in the horizontal plane. This scheme may be used also when both plates are made of the same material. This

Card 1/6

Methods of studying the ...

S/069/61/023/001/006/009  
B124/204

scheme serves the investigation of dry and boundary friction of polymers in order to study the behavior of the boundary layers of polymers at a solid surface. Scheme 6 may be used in tests with higher pressures. In this case, the immovable plates 3 have holes, into which the rods 1 and 4 of the tested material are placed, with the surface of the emerging part of the rods being pressed to the surface of the free plate 2. The contact is loaded by the piston which is adjusted upon the guide poles 4 by means of screw 19 which is turned by hand at the lever 18. The magnitude of the horizontal force whose maximum is equal to the frictional force F at the moment the samples begin to slide, is measured with the help of the deformation of the dynamometric ring 7. A WOB 14 (POB14) oscilloscope and a ГБIII (GBIII) galvanometer are used as measuring instruments. The friction coefficient ( $\mu$ ) is calculated from the equation  $\mu = F/2N$ . A second method is based upon wedging in by a cone which is placed in a conical opening. The device concerned (Fig. 3) was developed by V. P. Lazarev; it consists of an exchangeable conical metal sample 8 upon pole 2; the sample was placed into a conical opening of the massive thick-walled socket 9 which consists of an organic glass and is fixed to the base plate. Fig. 3 shows the annular sample 10 which is loaded by a vertical

B 124/204

Methods of studying the ...

force. The cone is fastened in the socket by a Teflon bearing (11). Axial pressure upon the cone is exerted by the lever 4 and transferred to the pole over the ball-and-socket support 3. In the investigation of the frictional properties during turning of the loaded sample in the socket, a special removable head 1, mounted co-axially with the socket upon the ball-bearing, is used. The arrangement is turned by the lever 5. There are 4 figures.

TITLE: Investigation of the Friction Properties of  
Solids at Elevated Hydrostatic Pressures

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, No. 6,  
pp. 132 - 133

TEXT: The authors have studied systematically the influence  
of increased pressure from all sides on the dry and boundary  
friction of materials. The investigations were carried out  
by simple equipment which enabled investigating the external  
friction at pressures up to 100 atm. in the surrounding  
medium. Fig. 1 shows a sketch of the apparatus used; it is  
a modification of the Deryagin-Lazarev tribometer, placed into  
a steel bomb inside which an elevated pressure is generated.  
The tribometer permits measuring the force of static friction  
between the surface of a flat plate displaced in the  
horizontal plane and a slide block resting on 3 supports. In  
investigating dry and boundary friction it is possible to  
apply needles as well as steel balls which are soldered onto

the surface of the slide block. The plate under investigation is displaced by means of a threaded nut which is operated by a reversible electric motor using reductor gears and appropriate seals in the wall of the bomb. By using teflon as the seal material it became possible to reduce considerably the friction losses in the seal. On displacing the plate, the friction force which is generated between its surface and the slide surface brings about bending of a steel rod which is connected to the slide and acts as a dynamometer. The deformation is observed visually by means of a microscope which penetrates through the lid of the bomb. The window is made of perspex and fixed to the lid using a rubber packing ring. Increased hydrostatic pressure of the medium is produced by connecting the bomb to a flask containing compressed gas. Investigations at pressures up to 15 atm. were carried out using an ordinary oxygen reductor, which

sea Hydrostatic Pressures

Maintaining constant pressure in the bomb even in  
case of high leakage. For higher pressures a special needle  
is used. The instrument enables investigating static  
friction not only in a gaseous media but also in any liquid.  
A small hydraulic pump from a laboratory or school press can  
be used. Fig.1 shows a sketch of the equipment for investigating  
the friction properties of solids at elevated pressures:

**Asphalts of the Okhotsky deposits.** Yu. V. Uranks and N. N. Teplykova. *Bull. Far. East. Branch Acad. Sci. U.S.S.R.* No. 21, 7 (20) (German) 27 (1959). Three samples of asphalt from the Okhotsky deposits (Soviet Sakhaline), analyzed to determine their origin and the feasibility of their industrial use, possess, depending on the depth of the strata (0-0.4 m.) and the location, the following properties: d<sub>40</sub> 1.020-1.032; moisture 0.50-10.22%; carbon, based on dry material, bitumen 77.60-96.28%; minerals 1.10-2.25%; oil content (mineral + bitumen) 1.10-20.11%; total S 0.38-0.60%; total N 0.71-0.007%; fractional compn.: to 150° 0.31%; 150-235° 0.0-0.9%; 235-270° 0.6-1%; 270-300° 0.21-0.6%; 300-400° 0.36-0.6%; 400-405° 0.3-1%; residue and losses 0.47-1%; technical properties: softening point 1-58.8°, flash point 135-195°, ignition point 213-245°, wt. loss on heating to 100° 4.10-28.55%, solv. in CS<sub>2</sub> 72.87-77.30%; solv. in petr. ether 54.29-68.96%. From the earth data the asphalts in this region are assumed to be the products of petroleum metamorphism after its egress to the earth's surface. Based on the tech. properties, the asphalts appear to be suitable as a binding agent in road construction. J. I.

TITLE: Glass textolite made with epoxy-novolacs binding agent

SOURCE: Plasticheskiye massy, no. 2, 1966, 13-15  
bonding material,

TOPIC TAGS: glass textolite, epoxy plastic, resin, tensile strength, glass fiber / ED-6 resin, No. 18 resin, 6E 18N-40 bonding material, 6E 18N-60 bonding material, TS 8/3-250 glass fiber, ASST(b)-C sub 2 glass fiber

ABSTRACT: Glass textolites have been prepared with various brands of glass fiber and epoxy-novolacs binder obtained from novolacs resin No. 18 and from epoxy resin ED-6. It was shown earlier by A. F. Nikolayev, M. S. Trizno, and N. A. Voronova (Plast. massy, No. 4, 76, 1965) that the most suitable compositions consisted of 45—55% of resin ED-6 and 55-45% of resin No. 18. The effect of the composition upon physical and mechanical properties of textolites has been reinvestigated, as was the effect of thermal treatment and of type of the glass fiber. It was shown that glass textolites made with binding agents

L 20808-66

ACC NR: AP6005947

6E 18N-40 and 6E 18N-60 had the highest tensile strength. Best conditions of thermal treatment, as applied to 10-mm thick tiles of 5-hedde glass fiber ASST(b)-C<sub>2</sub> with 6E 18N-40 binder, consisted of 10-hour heating at 180C. Of various brands of glass fiber tested, TS 8/3-250 with binder 6E 18N-40 yielded glass textolite of highest tensile strength (along warp, 6100-6600 kg x sec/cm<sup>2</sup>; along weft, 3200-3900 kg x sec/cm<sup>2</sup>). Orig. art. has: 4 tables.

TITLE: Possibility of regulating the content of functional groups on  
the surface of carbonaceous powders.

PERIODICAL: Zhurnal fizicheskoy khimii, v. 37, no. 3, 1963, 566-569

TEXT: Coke from petroleum cracking various types of carbon black, natural graphite, and GAY(BAU) carbon were ground in a vibration mill in the presence of air, and were then kept in air at 450° for 2 hrs. Carbon blacks were kept in H<sub>2</sub> at 800°C for 30 min and 900°C for 2 hrs. The content of carboxyl, phenyl, and carbonyl groups was determined. Results: (1) Treatment in the vibration mill increased the content of carbonyl groups considerably. (2) Functional groups containing oxygen are removed completely from the surface of carbon blacks by reduction in an H<sub>2</sub> atmosphere. (3) The content of functional groups in mg - equ per m<sup>2</sup> does not depend on the specific surface. Substances with a small specific surface, such as coke (0.41 m<sup>2</sup>/g) showed a high content of functional

Title : On the Method of Taking Plaster Casts in Topographic-Anatomical Investigations

Orig Pub : Arkhiv anatomii, gistol. i emriologii, 1957, 34,  
No 1, 117-119

Abstract : Plaster casts were taken from the posterior wall of  
the pericardium by the modified method of Volkov and  
Delitsin. After obtaining the negative cast a  
positive cast was made from it (plaster imprint) which  
was then painted and mounted on a board.

Personalities: Konvisarov, D. V.; Grechin, V. P., Sukhodol'skaya, Ye. A., Kislik, V. A.; Frolov, V.I.; Chernenko, D. N.; Dubinin, N. P.; Timofeyev, V. G.; and Kuznetsov, V. D., Materials tested: eutectic steel U 8. There are 3 tables and 10 Soviet references.

This collection of articles is meant for metallurgical & physicists and for engineers of the metal-working industry. This book contains results of research in the field of failure and plastic deformation of materials, mainly of metals. Problems of cutting, abrasion, friction, and wear of solid materials. (metals) are discussed.

TITLE: The Influence of the Structure of Cast Iron on its Abrasive Wear  
(Vliyaniye strukturny chuguna na yego abrazivnoye iznashivaniye)

PERIODICAL: V sb.: Treniye i iznos v mashinakh. Nr 12. Moscow, AN SSSR,  
1958, pp 42-63

ABSTRACT: It was established that best wear-resistant characteristics are exhibited by cast-iron specimens the metallic-base structure of which was obtained by means of quenching and tempering at a temperature of 400°C (troostite-sorbite). The wear is reduced if, without changing the total graphite content, the size of graphite inclusions (GI) is increased. Compared with lamellar GI's, the spheroidal variety exhibits greater wear resistance. The influence of internal stresses on wear characteristics was manifested in cast iron which had been subjected either to quenching without tempering or to quenching followed by tempering at low temperatures (100-150°). To achieve increased wear resistance in cast iron, heat-treatment procedures are required which produce a hard metallic base combined with relatively large GI's. A.S.

TITLE: The Effect of the Structure and the Quantity of Pearlite on Abrasive Wear of Cast Iron (Vliyanie stroyeniya i kolichestva perlita na abrazivnyy iznos chuguna)

PERIODICAL: V sb.: Issled. po fiz. tverdogo tela. Moscow, AN SSSR, 1957,  
pp 102-106

ABSTRACT: The effect of the shape and dispersion of the cementite particles in a pearlite matrix on wear resistance (WR) of steel and cast iron subjected to abrasive wear is established. The manner in which the quantity of pearlite contained in its basic metallic constituent affects the WR of cast iron operating under conditions of abrasive wear is also determined. The investigation of the effect of the shape of cementite in a pearlite matrix was performed on specimens of eutectoid steel U8 of the following chemical composition: 0.78% C, 0.32% Mn, 0.18% Si, 0.021% P, and 0.024% S. A considerable increase in relative WR of cast irons containing less than 50% pearlite was observed as their pearlite content was increased.
