TITLE: Rheological properties of low-molecular polymethylsiloxane polymer and of pastes derived from it

SOURCE: Kolloidnyy zhurnal, v. 28, no. 1, 1966, 39-45

TOPIC TAGS: silicon compound, siloxane, polymer, rubber, synthetic rubber, polymer rheology, rheologic property

ABSTRACT: The rheological properties of low-molecular weight (M = 37 000) polymethyl siloxane polymer and of white carbon-black (BS-280) pastes derived from it were studied. The experimental procedure was described by A. A. Trapeznikov, (Kolloidn. zh., 21, 108, 1959). The dependence of the tensile strength and viscosity of the polymer and pastes as a function of the white carbon-black filler concentration was determined. The experimental results are presented in graphs and tables (see Fig. 1). It was found that in the deformation velocity interval  $\dot{\epsilon}$  of 0.17 - 170 sec<sup>-1</sup>, the polymer behaved as a Newtonian liquid. Introduction of filler, up to 20 wt percent, leads to formation of suspensions, the properties of which are

2

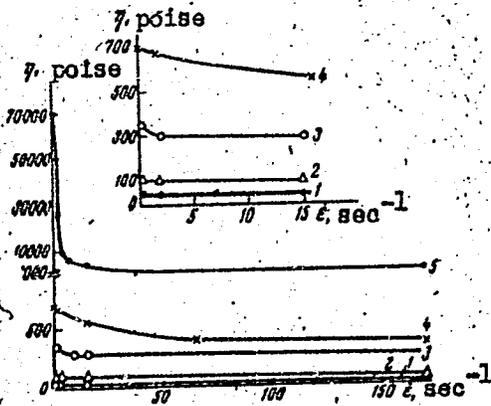

Fig. 1. Dependence of  $\eta - \dot{\epsilon}$  for the polymer (1) paste with 5 (2), 10 (3), and 20 (5) parts of BS-280 per 100 parts of polymer SKTN (low-molecular weight rubber).

similar to those of the polymer. The addition of larger amounts of filler causes the formation of thixotropic pastes exhibiting viscosity anomalies and weak tensile properties. It is concluded from electron-microscopy studies that the filler particles attain a maximum size of 200Å and are randomly dispersed throughout the system. Thanks are given to Z. N. Shulyak (VNIISHP) for kindly supplying the samples of white carbon-black. Orig. art. has: 3 tables and 7 graphs.

TITLE: The influence of organic compound additives<sup>11</sup> on the properties and micro-structure of lithium lubricating grease model

SOURCE: Kolloidnyy zhurnal, v. 28, no. 1, 1966, 146-150

TOPIC TAGS: lithium compound, organic lubricant, organometallic lubricant, lubricant additive, lubricant property

ABSTRACT: To extend the previously published work of A. A. Trapeznikov and G. G. Shchegolev (Kolloidn. zh., 24, 104, 1962), the effect of organic additives on the stability, synergetic properties, and microstructure of lithium lubricating grease was studied. Electron-microscope photographs of the greases are presented. The dependence of the structure strength limit (Pr) and compressibility (S) of the greases as a function of the concentration of the additives (fatty acid with 6 to 18 carbon atoms in the chain, lithium oleate, and nonylic alcohol) were studied. The experimental procedure followed is described by G. G. Shchegolev, A. M. Tolmachev, and A. A. Trapeznikov (Zavodsk. laboratoriya 25, 625, 1959). The experimental results are presented in graphs and tables (see Fig. 1).

ACC NR: AP6004199

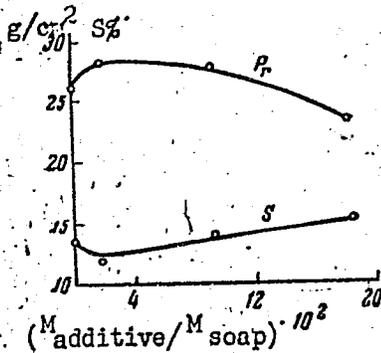

Fig. 1.

Dependence of (Pr) and (S) on the concentration nonyl alcohol additive for rapidly cooled ( $t_1 = 700$ ) grease lithium stearate - nonpolar vaseline oil.

It was found that the additives had a strengthening effect on the structure of lithium stearate grease. This effect decreased with increase in the molecular size of the additive. Lithium oleate was found to be the most effective and diphenylamine the least effective additive. From a study of electron-microscope pictures it is concluded that the strengthening effect of the additives is due to a change in the structural elements of the soap. Orig. art. has: 1 table and 4 graphs.

**\*The Effect of Layer Porosity on the Mechanical Properties of Magnesium Alloys of the MA-4 Type.** [Magnesium with 4 per cent. Aluminium.] A. K. Trajzernikov, M. S. Tardetnitakaya, and S. I. Eitingon (*Aciprom. (Al Ind.)*, 1940, (4/5), 32-36; *Chem. Zentr.*, 1941, 112, (1), 271).—[In Russian.] In an investigation of the mechanical properties of magnesium alloys of the MA-4 type, it was observed that these properties (with the exception of the bending strength and the notch impact strength) are higher for test-pieces cut from round bars (12.5 mm. diameter) than for those cut from square bars (22 x 22 mm.). At the same time X-ray examination revealed the presence, in the square bars, of the so-called "layer porosity," i.e., porous areas in the metal structure. These, which are characteristic of magnesium alloys, appear in fractures as yellow-grey spots with black sections running parallel or radially. They are apparently due to unsuitable cooling conditions in the metal during casting, and must be regarded as responsible for the deterioration of mechanical properties.

Strength Calculations: (Cont.)

SOV/3189

PURPOSE: This book is intended for engineers and designers <sup>in</sup> machine building as well as for engineers of other specialties working on stress analysis. It may be used as a text by students in the field.

COVERAGE: This book contains original stress analysis calculations made on machinery elements and parts. Analyses are made of coiled springs with an arbitrary helix angle, bending of turbine discs, strain state of flat pistons, and a circular cylinder. A number of original applications of general methods of the theory of elasticity to the study of lateral bending and torsion of rods is given. In the calculations on stability, new methods of determining critical forces for compressed rods and analyzing the stability of circular and ring-shaped plates are applied. Calculations for dynamic loadings are represented by a study of the analysis of variations of the indicators of devices during vibration. References accompany individual articles.

PART I. STRESS AND RIGIDITY ANALYSIS OF PARTS

Berman, M. E. (Deceased). Precise Analysis of Coiled Springs of Circular Cross-section With an Arbitrary Helix Angle	3
1. An analysis of standard ideas	3
2. Geometric properties of helical springs	7
3. Deformation hypothesis	8

Title: New Trends of Colloid Chemistry (Novye puti razvitiya kolloidnoy khimii)

Periodical: Vestnik Akademi nauk SSSR, 1959, Nr 1, pp 44-51 (USSR)

Periodical:

Abstract:

At present, colloid chemistry plays an especially important part in political economy and it is a physical-chemical science concerning substances of modern engineering. It is of great practical importance that at present it is possible to carry on uninterrupted transitions from lyophobic to lyophilic systems. Thus, it is possible to obtain chemically inert substances with the required structural-mechanical properties. The theory of highly molecular substances and their solutions has developed into an independent branch of colloid chemistry. The vitality of modern colloid chemistry is proved by the fact that it produces many new independent branches of science. Perhaps, the author describes the course of the 4th All-Union Conference of Colloid Chemistry which took place in Tallin on May 13-16, 1959.

P. G. KAROLYI (USSR), M. S. Yermak, A. P. Pisan and collaborators examined the process of the IR/UNION of active fillers on the processes of structural formation of polymers.

A. V. Kuznetsov with his school, A. A. Trapeznikov, G. V. Lindqvist and collaborators examined the properties of soap solutions in connection with their structural peculiarities and the theory of consistent lubricants. The reports on questions of dispersion systems in polymers shed the light on the physical chemistry of polymers of colloid chemistry. The conference indicates that, besides limited results on individual scientific problems, comprehensive conclusions are also useful. It is necessary, in the future, to make comprehensive scientific problems, comprehensive conclusions comprising the results of achievements in wide fields of science. There is 1 Soviet reference.

Temperature dependence of monolayer pressure as a method of investigating hydrates of higher aliphatic compounds. I. A. Trapeznikov. *Atta Physicochim. U.R.S.S.* 19, 563-70 (1944).—A new app. is described for the measurement of the temp. dependence of the 2-dimensional pressure and the viscosity of monolayers in equill. with a bulk cryst. phase. The new method was used in studying the properties of the hydrates of higher aliphatic compounds. The app. was an adaptation of the Wilberny method used in former work (C.A. 35, 771AP), and is housed in a thermostat that allows the temp. to be raised slowly and continuously with pauses at necessary points. The temp. dependence of a monolayer of tetradecyl alc. in equill. with a crystal or lens was investigated and was found to differ essentially from the dependence found by Cary and Richeal (C.A. 20, 133, 131). The exptl. curves obtained for the pressure,  $P_s = f(\text{temp.})$  can be divided into 3 characteristic temp. ranges: (1) a region of solid hydrate structures with the m.p. ( $T_1$ ) as the upper limit; (2) a region of liquid-cryst. structures limited by  $T_1$ , the temp. of their formation and  $T_2$ , the temp. at which they "clarify," i.e., transform into an isotropic liquid; and (3) a region of isotropic liquid lying above  $T_2$ . For tetradecyl alc. there is no change in the appearance of the crystal up to  $39.5^\circ$ ; the curve  $P_s = f(t)$  shows no change at the m.p. of anhyd. crystals and continues uninterrupted to  $38.5^\circ$ . At this temp., the pressure falls somewhat, reaching a min. at  $39^\circ$ ; then rises to a max. at  $40^\circ$ . At  $39.5^\circ$ , a visible transformation of the white, opaque hydrate into a new semi-transparent hydrate occurs and at  $40^\circ$  the latter melts into a lens. Region (2) is characterized by the formation in succession of two anisotropic liquid-cryst. phases. The formation of the first (I) takes place in the temp. range  $40.0-41.5^\circ$ . At  $41.0-41.5^\circ$ , internal pulsations arise within the phase, the lens often shakes and shatters and clear planes resembling phases of a crystal appear. These visible changes are accompanied by rapid increases and decreases in pressure, indicative of internal reconstruction of phase I into phase II. At  $42^\circ$  ( $T_2$ ),  $P_s$  reaches a max. and the pulsations cease. Phase II is less turbid than phase I. On increasing the temp. further, the pressure falls linearly and at  $55.0^\circ$  the turbidity disappears and the lens becomes optically empty. In the region  $T_2-T_3$ , three phases are often clearly discernible. Region (3) represents an isotropic transparent liquid, a soln. of  $H_2O$  in alc., and is characterized by a small neg. temp. coeff. of the equill. two-dimensional pressure. Thus, contrary to Cary and Richeal, who maintain that the isotropic liquid is formed at  $T_2$  (the point of max. pressure), the authors maintain that it is produced at  $T_3$ , and the region  $T_2-T_3$  corresponds to another anisotropic liquid phase. The authors also believe that the three-dimensional crystals of higher aliphatic compounds get "impregnated" with  $H_2O$  and form crystal hydrates of a definite structure and that for all states in the two-dimensional system analogs can be found in the three-dimensional system. These were not discernible previously in anhyd. systems. Thus, the solid hydrate structures may be assumed to correspond to the condensed phases in monolayers, the liquid-cryst. hydrates to the intermediate state in monolayers, and the isotropic liquid soln. of  $H_2O$  in alc., to the expanded state of a monolayer. **Generalized conformity criteria and optimum geometry of transformers.** TRAPEZNIKOV, V. A. *Elektrichestvo*.

(No. 2) 28-37 (1948) *In Russian.*—An improved and more accurate system of transformer design is proposed, based on the generally accepted Vidmar method developed in 1918. Both Cu and Fe circuits are considered in more detail, also the general cases of round and square windings not necessarily filling the window space. Economic relations between costs of Cu and Fe, analysis of losses, magnetization, W/kg figures, physical dimensions of iron cores and windings, etc., are tabulated and plotted in numerous nomograms. Their application is described in detail.

ABSTRACT: An account is given of the essential features of a method for full-scale testing and for physical and mathematical analog simulation of automatic-control systems. Included are circuits and descriptions of the various electronic and electromechanical elements of the latest mathematical analogs (i.e., computing elements, function-transforming elements, multiplier and divider elements, etc.) The authors describe briefly the principles of construction of mathematical analogs and list those that had been brought out by Soviet industry as of 1955; they mention also those built at the Institut avtomatiki i telemekhaniki AN SSSR (Institute of Automation and Telemechanics, Academy of Sciences, USSR). Included are general-view photographs of analog

Title : Mathematical analogies of dynamic systems

Periodical : Elektrichestvo, 8, 20-26, Ag 1955

Abstract : The article is written for wide circles of engineers and presents general principles of electric circuit analogies and of mathematical analog computing with electronic analyzers. The author describes the basic elements of the electronic analyzer of the EMU-5 type developed by V. V. Gurov at the Institute of Automation and Remote Control, Academy of Sciences, USSR. This device permits solving linear and non-linear problems. The author describes in detail an output electronic cascade amplifier and other devices which permit constructing analogies of various non-linear dynamic systems. He presents some examples of analog

TITLE: Tasks Facing the Technical Sciences in the Development of Automatic Control and Technical Means of Automation (Zadachi tekhnicheskikh nauk v razvitiy avtomaticheskogo upravleniya i tekhnicheskikh sredstv avtomatizatsii)

PERIODICAL: V sb.: Sessiya AN SSSR po nauch. probl. avtomatiz. proiz-va, 1956. Plenarn. zasedaniya, M., AS USSR, 1957, pp 38-55, discussion pp 55-65

ABSTRACT: These automatic-control methods are examined: (1) open-control systems; (2) reflector-type systems; (3) self-aligning systems. A brief description is presented of control systems for large technological complexes using computers and self-aligning devices. The most important automation problems are briefly cited: (1) Monitoring problem. Technological processes are listed for which no reliable automatic-monitoring method is available. The most important are tasks associated with checking composition of a substance. Theory and methods of converting a signal obtained from a pickup

Card 1/2

SOV/112-58-1-995

Tasks Facing the Technical Sciences in the Development of Automatic Control . . .

should be developed. The most important trends of development are: conversion of a signal into a discrete form, switching over to no-contact devices, use of computer techniques and means. (2) The problem of automatic regulation. The most important tasks are: (a) developing optimum regulation systems that would secure the quickest attainment of predetermined results within limitations existing in a real system; (b) development of extreme-type regulating systems; (c) development of automatic control systems capable of functioning under noise conditions. (3) Application of computers to automatic process control. A possibility is considered for creation of "self-aligning" systems that would automatically change their functioning conditions according to a preset or a chance law, would accumulate control experience and would most effectively conduct the production process. (4) Telemechanics problems. Unsolved theoretical problems are listed. Fundamental tasks are mapped out which arise in connection with a forthcoming adoption of automatic control by computer-type controllers.

AUTHOR: Kobrinskiy, A. Ye., Doctor of Technical Sciences 30-2-44/49

TITLE: Programmed Control of Metal Cutting Machines (Programmnoye upravleniye metallovezhushchimi stankami), All-Union Conference (Vsesoyuznoye soveshchaniye)

PERIODICAL: Vestnik Akademii Nauk SSSR, 1958, Nr 2, pp 113-115(USSR)

ABSTRACT: This conference took place in Moscow from November 13-16, 1957. It was called by the Institute for Engineering of the AN USSR, the Experimental Scientific Research Institute for Metal Processing Machines, as well as by the Institute for Machines and Tools in Moscow. The conference aimed at the following exchange of experience and decision as to the most important work to be carried out in this field in future. The conference was attended by representatives of the Councils of Political Economy, of industry, engineering departments, scientific research institutes as well as of universities. A. A. Blagonravov, director of the Institute for Engineering opened the conference. The following reports were given:

- 1) V.I. Dikushin reported on the present stage of the system of preset course in the USSR and its development.
- 2) A. P. Vladziyevskiy reported on the tasks in the field of

Card 1/3

Programmed Control of Metal Cutting Machines  
All-Union Conference

30-2-44/49

machine building in connection with preset course.

3) V. A. Trapeznikov reported on current work carried out by the Institute for Automation and Remote Control of the AN USSR.

4) M. G. Breydo and A. Ye. Kobrinskiy (Institute for Machinery) reported on work carried out with a modernized model of a milling machine. They also mentioned that M. L. Bykhovskiy and A. Ye. Kobrinskiy had put equations describing the step by step principle of preset course.

5) V. G. Zusman reported on the work carried out by the Institute for Metal Processing Machines.

6) A. M. Lebedev reported on semiconductor switches.

7) G. I. Kamenetskiy described hydraulic amplifiers and drives.

8) D.R. Kritskiy spoke on peculiarities of constructions.

9) A. V. Zinchenko reported on experimental results with a model of a milling machine.

10) I. P. Konstantinov spoke on the work of the Factory for Milling Machines, Dmitrovsk.

11) L. A. Gleyser reported on the control of a turning lathe by means of a perforated paper band.

12) L. M. Kaufman reported on turning lathes controlled by counters.

AUTHOR: Trapeznikov, V.A., Corresponding Member of the USSR Academy of Sciences, Director

TITLE: New Tasks (Novyye zadachi)

PERIODICAL: Nauka i zhizn', 1958, Nr 8, pp 2-3 (USSR)

ABSTRACT: The author starts by defining the conception of automation and automatics, and indicates the transition to continuous processes, the building of machines and assemblies combined into one group, and the increase of pressure and speeds as the main tendencies in the development of technological processes. In connection with the change of the operating system, a number of problems arise in respect to the automatic control, i.e. the measuring of a variety of quantities. Without solving these problems it is impossible to ensure a continuous running of all the links and numerous machines constituting the process. The wide development of the methods and means of control is of special significance. A further problem is operation with a very high degree of accuracy and speed. One of the principal problems of automatics is to create and apply such systems of operation which themselves find the most
