

TRILENKO, P.A.

"After this period of time has expired and the hemolytic mixture has been kept at room temperature for 10-20 minutes, it is added to the first phase of the reaction; 0.2 ml is added to the first tube, 0.4 ml to the second, 0.6 ml, to the third, etc., up to 1.4 ml to the seventh tube. After the mixtures have been kept in a water bath at 37-38°C for 20 minutes, the reactions are evaluated according to the hemolysis which has occurred; the largest quantity in the absence of which complete lysis of erythrocytes occurred is used as a titer (working dose) for the hemolytic system.

"The hemolytic mixture titered, by the aforementioned method is added to the tubes exhibiting a basic test and to the corresponding control; the tubes are shaken carefully and kept in a water bath at 37-38°C for 20 minutes. The reaction is read in the usual order.

ScM. 1305

TRILENKO, P. A.

"By the use of the above-described modification of the complement fixation reaction, 19 herds of cattle (2,015 head) with varying epizootiological records in regard to brucellosis were examined; positive results were obtained in 526 cases, whereas positive results were obtained in 400 cases when the usual complement fixation reaction was used, and in 240 cases with the agglutination reaction. A total of 584 cows from a brucellosis-free herd were examined; a doubtful agglutination reaction was obtained with their sera in seven cases, a complement fixation reaction in three cases, and a prolonged fixation reaction in two cases. The superiority of the latter method was also established on examination of sera from 113 horses, 168 sheep, and 31 humans. On the whole, it was found that with the prolonged complement fixation reaction, the diagnosis of brucellosis was 3.5-20% more successful than with the usual fixation, and 17.5-45.4% more successful than with the agglutination reaction. In old resurgent foci, the differences indicated were more pronounced than in fresh foci."

TITLE:

Multi-channel Photoelectric Devices DFS-10 for Emission
Spectrum Analysis

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 1013-1014
(USSR)

ABSTRACT:

The instrument mentioned in the title has a photoelectric re-
corder of the individual spectrum lines (SL) and is intended to
be used for rapid- and marking quantitative spectrum analyses
of metals and alloys. The instrument has 36 outlet slits sep-
arating 36 (SL). A special programming device makes possible
the simultaneous application of any desired combination of
12 (SL), using one (SL) as comparison line/ thus 11 elements
can be simultaneously determined in a sample. The instrument
has a polychromator (vertical scheme), a recording receiver and
a GEU-1 generator for electron regulation. The monochromatic
radiation is focussed by special mirrors on 36 photoelements
(with Sb/Cs-photo cathodes type STsV). The operation interval
of the instrument with the photoelements STsV is 2200-5500 Å.

Title : Some Aspects of the Spherical Harmonics Methods for Neutron Transport Problems in Cylindrical Geometry.

Orig Pub : Czechosl. fiz. zh., 1958, 8, No 4, 390-395

Abstract : The integral-differential equation of diffusion of monoenergetic neutrons is solved in the P_1 approximation in the case of a cylindrically-symmetrical inhomogeneous medium and a cylindrically-symmetrical distribution of the neutron sources. The solution of the system of equations thus obtained, a system which determines the spherical harmonics of the distribution function, is expressed

in terms of the Macdonald functions, and the problem is reduced to determining the coefficients of the corresponding Macdonald functions. A detailed examination is made of the determination of these coefficients in the case of a medium with isotropic scattering indicatrix. The results are in agreement with the results of Davison (Referat Zhur Fizika, 1958, No 10, 22433), but are obtained in a shorter manner. An analogous method is used to examine the case of the medium with anisotropic scattering indicatrix, which can be sufficiently well described by a sum of two first spherical harmonics. -- A.Ya. Temkin

X-ray study of certain synthetic rubbers: poly-chloroprene. H. LOUWIS and J. J. THOUAT (Compt. Rend. Acad. Sci., 1945, 219, 117-8; Rev. Gen. Chim., Doc. Anal., 1945, 22, 25). The authors have considered the case of polychloroprene which show some elastic properties and are capable of being vulcanised. Like natural rubber, pure and unstretched polychloroprene is amorphous. Stretched, it gives a fibre diagram different from that of Neoprene, provided it has been previously heated to 110°. Diagrams of polychloroprene vulcanised in the presence of metallic oxide show formation of bridge between the chains.

AUTHOR: Trifonov, N. P.

TITLE: High-Power Thermoelectric Wattmeter for Decimeter Band
(Termoelektricheskiy vattmetr bol'shoy moshchnosti detsimetrovogo diapazona)

PERIODICAL: Tekhnika televideniya (M-vo radiotekhn. prom-sti SSSR), 1957,
Nr 20-22, pp 146-154

ABSTRACT: A coaxial-line-type wattmeter for measuring power in the decimeter band is described. The power measured is dissipated in a terminal load whose temperature is measured by a set of series-connected thermocouples. The terminal load is, in fact, an absorbing film coating the inner surface of the outer conductor of the coaxial line. The wattmeter is calibrated by a low-frequency current passed through the wire heater. In case of the first model, the heater is placed into the load equivalent; in case of the second model, it is inserted into the load for the duration of wattmeter calibration. The scale span is 5-100 watts for the first model and 10-250 watts for the second. The error is $\pm 5-7\%$.

PURPOSE: This book is intended for persons working in the field of computer mathematics as well as students specializing in this field and others interested in the problems of performing operations on high speed digital computers.

COVERAGE: The book is basically a description of a system of standard

Card 1/7

System of Standard Subroutines

SOV/2291

subroutines which were applied at the Vychislitel'nyy tsentr (Computing Center) of Moscow State University in 1955-1956. The book consists of an introduction and two parts. In the introduction, principles of construction and operation of high speed digital computers and basic programming concepts and methods are discussed. In the first part is described the M-2 computer, located in the Laboratoriya upravlyayushchikh mashin i sistem (Control Machine and Systems Laboratory) of the Academy of Sciences, USSR, and built under the supervision of I. S. Bruk, Corresponding Member of the Academy. The peculiarities of programming and selecting a system of standard subroutines for this machine are discussed. In the second part of the book are found certain subroutines from the library suitable for the system selected. Although the subroutines have been selected with a specific machine in mind, the system as well as the algorithms can be completely and successfully applied to various automatic digital computers. These subroutines as well as the contents of the book were discussed at sessions of a seminar in which Academician S. L. Sobolev, Professor K. A. Semendyayev, and Docent I. S. Berezin took part together with coworkers of the Computer Center. The authors thank the latter for their valuable remarks, and also thank V. M. Vasil'yov and M. M. Yershova, both of the Computing Center at Moscow State University, for composing with

TITLE: The Solution of the Basic Problems of Structure Analysis on Universal Calculating Machines

PERIODICAL: Kristallografiya, 1959, Vol 4, Nr 3, pp 315-323 (USSR)

ABSTRACT: In 1954, programmes for crystallographic calculations on the digital calculating machine BESM were worked out and in 1956 repeated for the "Strela" machine of Moscow University. The following calculations can be made:

- 1) calculation of a net of values $\sigma(x, y)$ (Fourier synthesis, etc.);
- 2) allocation of phases (calculated) to observed amplitudes F_o and calculation of $\sigma(x, y)$;
- 3) calculation of F_o + calculation of $\sigma(x, y)$;
- 4) calculation of $(F_o - F_c)$ + calculation of $\sigma(x, y)$ (difference synthesis) ;
- 5) calculation and output of F_c ;
- 6) allocation to F_o of the phases of the calculated F_c and output of the F_o obtained;

Card1/3

SOV/70-4-3-7/32

The Solution of the Basic Problems of Structure Analysis on Universal
Calculating Machines

- 7) calculation and output of $(F_o - F_c)$;
- 8) refinement by the method of differential synthesis;
- 9) refinement by the method of differential synthesis
+ estimation of accuracy + calculation of $\sigma(x, y)$ from F_c .

The calculation of the Fourier synthesis is made at intervals of 1/60 or 1/120 of the unit cell edges with maximum indices of 30. The maximum number of F_{hk} values which can be used is 1524. For a centric-symmetric group the summation takes 10-30 minutes and for a non-centro-symmetric group twice as long.

Structure factors are calculated from the usual formula. f_i is held on the machine as a table in steps of 0.1 in $\sin \theta/\lambda$ and is found by linear interpolation. $\sin \theta/\lambda$ is calculated from $\sin \theta/\lambda = (Ah^2 + Bk^2 + Ck + D)^{1/2}$.

Up to 95 atoms of 24 sorts can be handled. Not more than 63 can be of one sort. The usual calculation time (for a zone) is 20-30 minutes, including a double check.

Card2/3

SOV/70-4-3-7/32

The Solution of the Basic Problems of Structure Analysis on Universal
Calculating Machines

Each refinement cycle (of a zone) takes an average time
of 35-40 min.

TITLE: Properties of the programming program for Strela-4

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-1-16 m (In collection: Sistema avtomatiz. programirovaniya, M., Fizmatgiz, 1961, 71 - 84)

TEXT: The basic ideas in the design and structure of the programming program written at the Vychislitel'nyy tsentr MGU (Computer Center, MGU) are described. The basis of this programming program (PP) is the method of standard subschemes. A standard sub-scheme is a part of the logical scheme (LS) realizing a certain algorithm and permitting of a standard description independently of the problem in which the given algorithm is realized (e.g. cycles). The standard subschemes are described in a symbolic notation and they are transcribed by special blocks of the PP into a complete LS in terms of the basic types of operators used in this PP. This accomplishes

Card 1/3

S/194/62/000/007/003/160
D222/D309

Properties of the programming ...

an intermediate stage of programming. Standard subschemes of various levels can be used, and correspondingly the programming can be organized with several intermediate stages. The initial information for PP is LS, a table (T) showing the dependence of quantities on the parameters, and some general information. Six types of operators are permitted in LS: A - arithmetical, O - restoration, F - address modification, Φ - forming, N - nonstandard, DK - auxiliary constants. In LS the use of standard subschemes f is permitted. A short description of these operators is given. The initial information for A is given in the form of a system of formulas $f_1(x_1, x_2, \dots, x_k) \Rightarrow \Rightarrow x_j$. The table T showing the dependence of the quantities on the parameters contains the parameters of the program and the accompanying information on the modification of the corresponding addresses when the parameters are changed by unity. The general information contains a table of symbolic addresses, a table of external addresses, a table of intervals and a table of storage allocation. The last of these serves for the processing of a given program with the standard-component program CCP-2 (SSP-2). The system of information coding is given - i.e. the distribution of symbolic

Card 2/3

Properties of the programming ...

S/194/62/000/007/003/160
D222/D309

numbers in PP - and also the symbolic numbers for coding the operators and the corresponding indicators. In order to prepare the initial information for input there is an auxiliary program for preliminary processing. The PP consists of the following blocks: B - input, f - standard subschemes, C - auxiliary block (to form short LS's), B - processing of nonstandard operators, A - arithmetics, E - working-cell economy block. O, F and Φ are blocks for restoration, address modification and forming, RP is a block for ordering and the assignment of addresses. All blocks of PP are written on magnetic tape and are brought sequentially into the operative memory of the computer. [Abstracter's note: Complete translation.]

TITLE: Block of standard subschemes

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 7, 1962, abstract 7-1-17 k (In collection: Sistema avtomatiz. programirovaniya, M., Fizmatgiz, 1961, 125 - 134)

TEXT: The block of standard subschemes (SS) is intended for the replacement of the symbolic notations in SS by the corresponding parts of the logical scheme (LS), described in terms of basic types of operators. In the library of SS's the most frequent SS's are included - cycle with restoration and cycle without restoration. The LS for a cycle with restoration is of the form: $S_1 = 0(i)$

X

$S_0(i) F(i) p(i \dots i_k)$, where O and F are restoration and address-modification operators. A part of LS can contain cycles. In this case cycle S_1 has a rank k if S_0 contains at least one cycle of

Card 1/3

S/194/62/000/007/004/160
D222/D309

Block of standard subschemes

rank $k-1$ and does not contain cycles of higher ranks. The logical condition is realized in the most general way by a counter. In LS information on SS is given by a symbolic notation of the form

$N_1 \{S_0\} N_2 (f_1 i, i_0, i_k)$, which means that for a part of LS we have to write down the scheme of a cycle with restoration (f_1) with respect to the parameter i , the initial and final values of the parameter being i_0 and i_k respectively, while the first operator of this cycle must be numbered N_1 , and the last N_2 . The algorithm for the operation of block SS is described. In a preliminary calculation the so-called symbolic ranks of the cycles are determined and a table of SS is formed. This preliminary work is done by the first part of the block, after which there follows the writing down of the cycle. The first stage is the assignment of numbers to the operators. During the second stage the information is prepared for the O and F operators. In the third stage the arithmetical operators \bar{A} and \bar{A} are formed, (the counter is restored and one is subtracted

Card 2/3

Block of standard subschemes

from the counter to obtain the indicator), and also a non-standard operator E which ends the cycle. The final stage includes the ordering of the operators into a complete LS using the information which has been prepared. An enlarged block diagram of the program for the processing of cycles is given. 1 figure. [Abstracter's note: Complete translation.]

TITLE: The possibilities of using hydraulic impacts in metal-cutting machine tools

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 12, 1962, 62 - 63, abstract 12B397 (V sb. "Issled. v.obl. metallorēzh. stankov", no. 4, Moscow, Mashgiz, 1961, 220 - 237)

TEXT: During an oscillating motion of the cutting edge of the tool in the cutting plane the adherence of the chip to the tool front edge decreases which, in some cases, leads to an improved surface. For this purpose a hydraulic vibration drive has been developed whose operation is based on the utilization of the phenomenon of hydraulic impacts, i.e. an abrupt increase in pressure in the system if the oil flow rate is changed. The author carried out theoretical investigations of the phenomenon of hydraulic impact in this drive. The graphic method is used for determining the relative pressure increase at the beginning and at the end of the pipeline for any period. This investigation was carried out

Card 1/2

The possibilities of...

S/123/62/000/012/009/010
A004/A101

both for a continuous and for an interrupted oil flow, which is interesting inas-
much as in some pipeline sections, during the superposition of the forward and
back waves, stresses may arise which exceed the admissible stress of oil rupture
and promote a liberation of vapors and dissolved air from the oil. The cavi-
tation phenomenon in mineral oil was studied with a high-speed motion-picture
camera. It was found that during the piston travel under cavitation conditions
a constant pressure is established in front of the piston. This is made use of
in deriving the equation of the piston motion during cavitation. Based on the
theoretical and experimental investigations, the model 5714 gear shaving machine
has been modernized, ensuring the application of oscillating motions to the gear
being shaved in the cutting plane which improves the finish quality of toothed
wheels. There are 17 figures and 5 references.

TITLE: Deep structure of the Earth's crust in the Belozersk iron ore region based on seismic data

SOURCE: AN UkrSSR. Geofizicheskiy sbornik, no. 18, 1966. Geofizicheskiye issledovaniya stroeniya zemnoy kory (Geophysical investigations of the structure of the earth's crust), 3-18

TOPIC TAGS: geologic survey, earth crust, seismology, petrology, mineralogy

ABSTRACT: Seismic investigations of the Belozersk iron ore region revealed that the basement in the region is composed of the earliest Precambrian formations and the basaltic shell is greatly uplifted. Hence it is natural to assume that a block of the Earth's crust has been elevated in the Belozersk region relative to adjacent regions. This uplifting of the block of the basaltic shell occurred along the ancient Belozersk submeridional deep fault zone and was accompanied by the penetration and fusion of basic and ultrabasic rock varieties in the upper levels of the crust. A comparison of the structural map of the surface of the basaltic

Card 1/2

ACC NR: AT7003831

shell with the gravimetric map revealed their good qualitative agreement. Thus the gravity anomalies in the Belozersk region are due not to petrographic inhomogeneities of the basement but mainly to the surface relief of the basaltic shell. It is assumed that in other regions of the Ukrainian shield the main gravitational effect is also produced by density boundaries within the Precambrian strata. In the overall qualitative conformity of the gravitational map of the basaltic shell of the Belozersk region, no direct relation was found between the magnitude of the anomalies and the depths to the basalt. This was apparently due primarily to density inhomogeneities in the basaltic shell itself. Orig. art. has: 10 figures.
